PYRAD.FLOW.FLOW_AUX

Auxiliary functions to control the Pyrad data processing flow

initialize_listener()	initialize the input listener
_user_input_listener(input_queue)	Permanently listens to the keyword input until the user
	types "Return"
_get_times_and_traj(*args, **kwargs)	wrapper
_initialize_datasets(dataset_levels, cfg[,	Initializes datasets.
])	
_process_datasets(*args, **kwargs)	wrapper
_postprocess_datasets(dataset_levels, cfg,	Processes the radar volumes for a particular time stamp.
dscfg)	
waitforfiles(nowtime, datacfg, datatype_list)	Waits for the master file and all files in a volume scan to
	be present returns the masterfile if the volume scan can
	be processed.
_get_radars_data(*args, **kwargs)	wrapper
_generate_dataset(*args, **kwargs)	wrapper
_generate_prod(*args, **kwargs)	wrapper
_create_cfg_dict(*args, **kwargs)	wrapper
_create_datacfg_dict(*args, **kwargs)	wrapper
_create_dscfg_dict(*args, **kwargs)	wrapper
_create_prdcfg_dict(*args, **kwargs)	wrapper
_get_datatype_list(*args, **kwargs)	wrapper
_get_datasets_list(*args, **kwargs)	wrapper
_get_masterfile_list(*args, **kwargs)	wrapper
_add_dataset(*args, **kwargs)	wrapper
_warning_format(message, category, filename,	
)	

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._create_datacfg_dict(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._create_prdcfg_dict(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._generate_dataset(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow_aux._get_datasets_list(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._get_datatype_list(*args, **kwargs)
    wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._get_masterfile_list(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._get_radars_data(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._get_times_and_traj(*args, **kwargs)
     wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._initialize_datasets (dataset_levels, cfg, traj=None, infostr=None)
Initializes datasets. Creates the data set configuration dictionary
```

Parameters

dataset_levels [dict] dictionary containing the list of data sets to be generated at each processing level

```
cfg [dict] processing configuration dictionary
```

traj [trajectory object] object containing the trajectory

infostr [str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

Returns

dscfg [dict] dictionary containing the configuration data for each dataset

traj [trajectory object] the modified trajectory object

```
pyrad.flow.flow_aux._initialize_listener()
    initialize the input listener
```

Returns

input_queue [queue object] the queue object where to put the quit signal

```
pyrad.flow.flow_aux._postprocess_datasets(dataset_levels, cfg, dscfg, traj=None, in-
fostr=None)
```

Processes the radar volumes for a particular time stamp.

Parameters

dataset_levels [dict] dictionary containing the list of data sets to be generated at each processing level

cfg [dict] processing configuration dictionary

dscfg [dict] dictionary containing the configuration data for each dataset

traj [trajectory object] and object containing the trajectory

infostr [str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

Returns

```
dscfg [dict] the modified configuration dictionary
```

traj [trajectory object] the modified trajectory object

```
pyrad.flow.flow_aux._process_datasets(*args, **kwargs)
    wrapper
```

Parameters

args, kwargs [arguments] The arguments of the function

Returns

func [function] The original function if no profiling has to be performed or the function decorated with the memory decorator

```
pyrad.flow.flow_aux._user_input_listener(input_queue)
```

Permanently listens to the keyword input until the user types "Return"

Parameters

input_queue [queue object] the queue object where to put the quit signal

```
pyrad.flow.flow_aux._wait_for_files (nowtime, datacfg, datatype_list, last_processed=None)
Waits for the master file and all files in a volume scan to be present returns the masterfile if the volume scan can be processed.
```

Parameters

nowtime [datetime object] the current time

datacfg [dict] dictionary containing the parameters to get the radar data

last_processed [datetime or None] The end time of the previously processed radar volume

Returns

masterfile [str or None] name of the master file. None if the volume was not completemasterdatatypedescr [str] the description of the master data typelast_processed [datetime] True of all scans found

pyrad.flow.flow_aux._wait_for_rainbow_datatypes (rainbow_files, period=30) waits until the files for all rainbow data types are present.

Parameters

rainbow_files [list of strings] a list containing the names of all the rainbow files to wait for **period** [int] the time it has to wait (s)

Returns

found all [Boolean] True if all files were present. False otherwise

```
pyrad.flow.flow_aux.profiler(level=1)
```

Function to be used as decorator for memory debugging. The function will be profiled or not according to its level respect to the global variable PROFILE_LEVEL

Parameters

level [int] profiling level

Returns

func or func wrapper [function] The function or its wrapper for profiling

pyrad library reference for developers,	Release 0.0.1	

PYRAD.FLOW.FLOW CONTROL

functions to control the Pyrad data processing flow

main(cfgfile[, starttime, endtime,])	Main flow control.
<pre>main_rt(cfgfile_list[, starttime, endtime,])</pre>	main flow control.

```
pyrad.flow.flow_control.main(cfgfile, starttime=None, endtime=None, trajfile=", tra-
jtype='plane', flashnr=0, infostr=", MULTIPROCESS-
ING_DSET=False, MULTIPROCESSING_PROD=False, PRO-
FILE MULTIPROCESSING=False)
```

Main flow control. Processes radar data off-line over a period of time given either by the user, a trajectory file, or determined by the last volume processed and the current time. Multiple radars can be processed simultaneously

Parameters

cfgfile [str] path of the main config file

starttime, endtime [datetime object] start and end time of the data to be processed

trajfile [str] path to file describing the trajectory

trajtype [str] type of trajectory file. Can be either 'plane' or 'lightning'

flashnr [int] If larger than 0 will select a flash in a lightning trajectory file. If 0 the data corresponding to the trajectory of all flashes will be plotted

infostr [str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

MULTIPROCESSING_DSET [Bool] If true the generation of datasets at the same processing level will be parallelized

MULTIPROCESSING_PROD [Bool] If true the generation of products from each dataset will be parallelized

main flow control. Processes radar data in real time. The start and end processing times can be determined by the user. This function is inteded for a single radar

Parameters

cfgfile_list [list of str] path of the main config files

starttime, endtime [datetime object] start and end time of the data to be processed

infostr_list [list of str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

proc_period [int] period of time before starting a new processing round (seconds)

cronjob_controlled [Boolean] If True means that the program is started periodically from a cronjob and therefore finishes execution after processing

proc_finish [int or None] if set to a value the program will be forced to shut down after the value (in seconds) from start time has been exceeded

Returns

end_proc [Boolean] If true the program has ended successfully

PYRAD.PROC.PROCESS_AUX

Auxiliary functions. Functions to determine the process type, pass raw data to the product generation functions, save radar data and extract data at determined points or regions of interest.

get_process_func(dataset_type, dsname)	Maps the dataset type into its processing function and
	data set format associated.
process_raw(procstatus, dscfg[, radar_list])	Dummy function that returns the initial input data set
process_save_radar(procstatus, dscfg[,])	Dummy function that allows to save the entire radar ob-
	ject
process_roi(procstatus, dscfg[, radar_list])	Obtains the radar data at a region of interest.
process_grid(procstatus, dscfg[, radar_list])	Puts the radar data in a regular grid
process_azimuthal_average(procstatus,	Averages radar data in azimuth obtaining and RHI as a
dscfg)	result

pyrad.proc.process_aux.get_process_func(dataset_type, dsname)

Maps the dataset type into its processing function and data set format associated.

Parameters

dataset_type [str] data set type, i.e. 'RAW', 'SAN', etc.

dsname [str] Name of dataset

Returns

func_name [str or processing function] pyrad function used to process the data set type **dsformat** [str] data set format, i.e.: 'VOL', etc.

pyrad.proc.process_aux.process_azimuthal_average (procstatus, dscfg, radar_list=None)
Averages radar data in azimuth obtaining and RHI as a result

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

gridconfig [dictionary. Dataset keyword] Dictionary containing some or all of this keywords: xmin, xmax, ymin, ymax, zmin, zmax : floats

minimum and maximum horizontal distance from grid origin [km] and minimum and maximum vertical distance from grid origin [m] Defaults -40, 40, -40, 40, 0., 10000.

hres, vres [floats] horizontal and vertical grid resolution [m] Defaults 1000., 500.

latorig, lonorig, altorig [floats] latitude and longitude of grid origin [deg] and altitude of grid origin [m MSL] Defaults the latitude, longitude and altitude of the radar

wfunc [str] the weighting function used to combine the radar gates close to a grid point. Possible values BARNES, CRESSMAN, NEAREST_NEIGHBOUR Default NEAR-EST NEIGHBOUR

roif_func [str] the function used to compute the region of interest. Possible values: dist_beam, constant

roi [float] the (minimum) radius of the region of interest in m. Default half the largest resolution

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the gridded data
ind rad [int] radar index

pyrad.proc.process_aux.**process_grid** (procstatus, dscfg, radar_list=None)

Puts the radar data in a regular grid

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

gridconfig [dictionary. Dataset keyword] Dictionary containing some or all of this keywords: xmin, xmax, ymin, ymax, zmin, zmax : floats

minimum and maximum horizontal distance from grid origin [km] and minimum and maximum vertical distance from grid origin [m] Defaults -40, 40, -40, 40, 0., 10000.

hres, vres [floats] horizontal and vertical grid resolution [m] Defaults 1000., 500.

latorig, lonorig, altorig [floats] latitude and longitude of grid origin [deg] and altitude of grid origin [m MSL] Defaults the latitude, longitude and altitude of the radar

wfunc [str] the weighting function used to combine the radar gates close to a grid point.
Possible values BARNES, CRESSMAN, NEAREST_NEIGHBOUR Default NEAR-EST NEIGHBOUR

roif_func [str] the function used to compute the region of interest. Possible values: dist_beam, constant

roi [float] the (minimum) radius of the region of interest in m. Default half the largest resolution

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the gridded data
ind rad [int] radar index

```
pyrad.proc.process_aux.process_raw (procstatus, dscfg, radar_list=None)

Dummy function that returns the initial input data set
```

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configurationradar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind rad [int] radar index

pyrad.proc.process_aux.**process_roi** (*procstatus*, *dscfg*, *radar_list=None*)

Obtains the radar data at a region of interest.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:datatype [string. Dataset keyword] The data type where we want to extract the point mea-

radar list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the data and metadata at the point of interest
ind_rad [int] radar index

pyrad.proc.process_aux.**process_save_radar** (procstatus, dscfg, radar_list=None)

Dummy function that allows to save the entire radar object

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configurationradar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

id library referei	nce for develop	ers, Release	0.0.1		

PYRAD.PROC.PROCESS_CALIB

Functions for monitoring data quality and correct bias and noise effects

$process_correct_bias(procstatus, dscfg[,])$	Corrects a bias on the data	
process_correct_noise_rhohv(procstatus,	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3:	
dscfg)	Precipitation	
process_gc_monitoring(procstatus, dscfg[,	computes ground clutter monitoring statistics	
])		
process_occurrence(procstatus, dscfg[,])	computes the frequency of occurrence of data.	
process_occurrence_period(procstatus,	computes the frequency of occurrence over a long pe-	
dscfg)	riod of time by adding together shorter periods	
<pre>process_sun_hits(procstatus, dscfg[, radar_list])</pre>	monitoring of the radar using sun hits	

Parameters

```
procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
    datatype [string. Dataset keyword] The data type to correct for bias
    bias [float. Dataset keyword] The bias to be corrected [dB]. Default 0
radar_list [list of Radar objects] Optional. list of radar objects
```

Returns

```
new_dataset [dict] dictionary containing the output
ind_rad [int] radar index
```

```
pyrad.proc.process_calib.process_correct_noise_rhohv (procstatus, dscfg, radar_list=None)
identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation
```

Parameters

```
    procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
    dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
    datatype [list of string. Dataset keyword] The data types used in the correction
    radar_list [list of Radar objects] Optional. list of radar objects
```

Returns

new_dataset [dict] dictionary containing the output

ind rad [int] radar index

pyrad.proc.process_calib.**process_gc_monitoring** (procstatus, dscfg, radar_list=None) computes ground clutter monitoring statistics

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

excessgatespath [str. Config keyword] The path to the gates in excess of quantile location

excessgates_fname [str. Dataset keyword] The name of the gates in excess of quantile file

datatype [list of string. Dataset keyword] The input data types

step [float. Dataset keyword] The width of the histogram bin. Default is None. In that case the default step in function get_histogram_bins is used

regular_grid [Boolean. Dataset keyword] Whether the radar has a Boolean grid or not. Default False

val_min [Float. Dataset keyword] Minimum value to consider that the gate has signal. Default None

filter_prec [str. Dataset keyword] Give which type of volume should be filtered. None, no filtering; keep_wet, keep wet volumes; keep_dry, keep dry volumes.

rmax_prec [float. Dataset keyword] Maximum range to consider when looking for wet gates [m]

percent_prec_max [float. Dataset keyword] Maxim percentage of wet gates to consider the volume dry

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [Radar] radar object containing histogram data

ind_rad [int] radar index

pyrad.proc.process_calib.**process_occurrence** (*procstatus*, *dscfg*, *radar_list=None*) computes the frequency of occurrence of data. It looks only for gates where data is present.

Parameters

processing [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

regular_grid [Boolean. Dataset keyword] Whether the radar has a Boolean grid or not. Default False

rmin, rmax [float. Dataset keyword] minimum and maximum ranges where the computation takes place. If -1 the whole range is considered. Default is -1

val_min [Float. Dataset keyword] Minimum value to consider that the gate has signal. Default None

filter_prec [str. Dataset keyword] Give which type of volume should be filtered. None, no filtering; keep_wet, keep wet volumes; keep_dry, keep dry volumes.

rmax_prec [float. Dataset keyword] Maximum range to consider when looking for wet gates [m]

percent_prec_max [float. Dataset keyword] Maxim percentage of wet gates to consider the volume dry

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_calib.process_occurrence_period(procstatus,

dscfg,

radar_list=None)

computes the frequency of occurrence over a long period of time by adding together shorter periods

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

regular_grid [Boolean. Dataset keyword] Whether the radar has a Boolean grid or not. Default False

rmin, rmax [float. Dataset keyword] minimum and maximum ranges where the computation takes place. If -1 the whole range is considered. Default is -1

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_calib.**process_sun_hits** (procstatus, dscfg, radar_list=None) monitoring of the radar using sun hits

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for a sun hit signal [m]. Default 50000.

hmin [float. Dataset keyword] minimum altitude where to look for a sun hit signal [m MSL]. Default 10000. The actual range from which a sun hit signal will be search will be the minimum between rmin and the range from which the altitude is higher than hmin.

delev_max [float. Dataset keyword] maximum elevation distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5

dazim_max [float. Dataset keyword] maximum azimuth distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5

elmin [float. Dataset keyword] minimum radar elevation where to look for sun hits [deg]. Default 1.

- **nbins_min** [int. Dataset keyword.] minimum number of range bins that have to contain signal to consider the ray a potential sun hit. Default 10.
- attg [float. Dataset keyword] gaseous attenuation. Default None
- max_std_pwr [float. Dataset keyword] maximum standard deviation of the signal power to consider the data a sun hit [dB]. Default 2.
- max_std_zdr [float. Dataset keyword] maximum standard deviation of the ZDR to consider the data a sun hit [dB]. Default 2.
- az_width_co [float. Dataset keyword] co-polar antenna azimuth width (convoluted with sun width) [deg]. Default None
- **el_width_co** [float. Dataset keyword] co-polar antenna elevation width (convoluted with sun width) [deg]. Default None
- az_width_cross [float. Dataset keyword] cross-polar antenna azimuth width (convoluted with sun width) [deg]. Default None
- **el_width_cross** [float. Dataset keyword] cross-polar antenna elevation width (convoluted with sun width) [deg]. Default None
- **ndays** [int. Dataset keyword] number of days used in sun retrieval. Default 1
- coeff_band [float. Dataset keyword] multiplicate coefficient to transform pulse width into receiver bandwidth
- radar_list [list of Radar objects] Optional. list of radar objects

Returns

- sun_hits_dict [dict] dictionary containing a radar object, a sun_hits dict and a sun_retrieval
 dictionary
- ind_rad [int] radar index

CHAPTER

FIVE

PYRAD.PROC.PROCESS COSMO

Functions to manage COSMO data

process_cosmo(procstatus, dscfg[, radar_list])	Gets COSMO data and put it in radar coordinates
process_hzt(procstatus, dscfg[, radar_list])	Gets iso0 degree data in HZT format and put it in radar
	coordinates
process_cosmo_lookup_table(procstatus,	Gets COSMO data and put it in radar coordinates using
dscfg)	look up tables computed or loaded when initializing
<pre>process_hzt_lookup_table(procstatus, dscfg)</pre>	Gets HZT data and put it in radar coordinates using look
	up tables computed or loaded when initializing
process_cosmo_coord(procstatus, dscfg[,])	Gets the COSMO indices corresponding to each cosmo
	coordinates
process_hzt_coord(procstatus, dscfg[,])	Gets the HZT indices corresponding to each HZT coor-
	dinates

pyrad.proc.process_cosmo.process_cosmo (procstatus, dscfg, radar_list=None) Gets COSMO data and put it in radar coordinates

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] arbitrary data type

keep_in_memory [int. Dataset keyword] if set keeps the COSMO data dict, the COSMO coordinates dict and the COSMO field in radar coordinates in memory

regular_grid [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and there is no need to compute a new COSMO field if the COSMO data has not changed

cosmo_type [str. Dataset keyword] name of the COSMO field to process. Default TEMP

cosmo_variables [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_cosmo.process_cosmo_coord (procstatus, dscfg, radar_list=None)
Gets the COSMO indices corresponding to each cosmo coordinates

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] arbitrary data type

cosmopath [string. General keyword] path where to store the look up table

radar list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_cosmo_lookup_table (procstatus,

dscfg,

radar_list=None)

Gets COSMO data and put it in radar coordinates using look up tables computed or loaded when initializing

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] arbitrary data type

lookup_table [int. Dataset keyword] if set a pre-computed look up table for the COSMO coordinates is loaded. Otherwise the look up table is computed taking the first radar object as reference

regular_grid [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and therefore there is no need to interpolate the COSMO field in memory to the current radar grid

cosmo_type [str. Dataset keyword] name of the COSMO field to process. Default TEMP

cosmo_variables [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind rad [int] radar index

pyrad.proc.process_cosmo.**process_hzt** (*procstatus*, *dscfg*, *radar_list=None*)

Gets iso0 degree data in HZT format and put it in radar coordinates

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] arbitrary data type

keep_in_memory [int. Dataset keyword] if set keeps the COSMO data dict, the COSMO coordinates dict and the COSMO field in radar coordinates in memory

regular_grid [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and there is no need to compute a new COSMO field if the COSMO data has not changed cosmo_type [str. Dataset keyword] name of the COSMO field to process. Default TEMPcosmo_variables [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_cosmo.**process_hzt_coord** (procstatus, dscfg, radar_list=None)
Gets the HZT indices corresponding to each HZT coordinates

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [string. Dataset keyword] arbitrary data type
 cosmopath [string. General keyword] path where to store the look up table
radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_cosmo.process_hzt_lookup_table (procstatus,

dscfg,

radar_list=None)

Gets HZT data and put it in radar coordinates using look up tables computed or loaded when initializing

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] arbitrary data type

lookup_table [int. Dataset keyword] if set a pre-computed look up table for the COSMO coordinates is loaded. Otherwise the look up table is computed taking the first radar object as reference

regular_grid [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and therefore there is no need to interpolate the COSMO field in memory to the current radar grid

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad library reference for developers, Release 0.0.1

PYRAD.PROC.PROCESS DOPPLER

Functions for processing Doppler related parameters

<pre>process_dealias_fourdd(procstatus, dscfg[,])</pre>	Dealiases the Doppler velocity field using the 4DD technique from Curtis and Houze, 2001	
process_dealias_region_based(procstatus,	Dealiases the Doppler velocity field using a region	
dscfg)	based algorithm	
process_dealias_unwrap_phase(procstatus,	Dealiases the Doppler velocity field using multi-	
dscfg)	dimensional phase unwrapping	
<pre>process_wind_vel(procstatus, dscfg[, radar_list])</pre>	Estimates the horizontal or vertical component of the	
	wind from the radial velocity	
process_windshear(procstatus, dscfg[,])	Estimates the wind shear from the wind velocity	
process_vad(procstatus, dscfg[, radar_list])	Estimates vertical wind profile using the VAD (velocity	
	Azimuth Display) technique	

pyrad.proc.process_Doppler.process_dealias_fourdd (procstatus,

dscfg,

radar_list=None)

Dealiases the Doppler velocity field using the 4DD technique from Curtis and Houze, 2001

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

filt [int. Dataset keyword] Flag controlling Bergen and Albers filter, 1 = yes, 0 = no.

sign [int. Dataset keyword] Sign convention which the radial velocities in the volume created from the sounding data will will. This should match the convention used in the radar data. A value of 1 represents when positive values velocities are towards the radar, -1 represents when negative velocities are towards the radar.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_Doppler.process_dealias_region_based(procstatus,

dscfg,

radar list=None)

Dealiases the Doppler velocity field using a region based algorithm

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

interval_splits [int, optional] Number of segments to split the nyquist interval into when finding regions of similar velocity. More splits creates a larger number of initial regions which takes longer to process but may result in better dealiasing. The default value of 3 seems to be a good compromise between performance and artifact free dealiasing. This value is not used if the interval_limits parameter is not None.

skip_between_rays, **skip_along_ray** [int, optional] Maximum number of filtered gates to skip over when joining regions, gaps between region larger than this will not be connected. Parameters specify the maximum number of filtered gates between and along a ray. Set these parameters to 0 to disable unfolding across filtered gates.

centered [bool, optional] True to apply centering to each sweep after the dealiasing algorithm so that the average number of unfolding is near 0. False does not apply centering which may results in individual sweeps under or over folded by the nyquist interval.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_Doppler.process_dealias_unwrap_phase(procstatus, dscfg, radar_list=None)

Dealiases the Doppler velocity field using multi-dimensional phase unwrapping

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

unwrap_unit [{'ray', 'sweep', 'volume'}, optional] Unit to unwrap independently. 'ray' will unwrap each ray individually, 'sweep' each sweep, and 'volume' will unwrap the entire volume in a single pass. 'sweep', the default, often gives superior results when the lower sweeps of the radar volume are contaminated by clutter. 'ray' does not use the gatefilter parameter and rays where gates ared masked will result in poor dealiasing for that ray.

radar list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_Doppler.**process_vad** (*procstatus*, *dscfg*, *radar_list=None*) Estimates vertical wind profile using the VAD (velocity Azimuth Display) technique

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:datatype [string. Dataset keyword] The input data type

```
radar_list [list of Radar objects] Optional. list of radar objects
```

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_Doppler.process_wind_vel (procstatus, dscfg, radar_list=None) Estimates the horizontal or vertical component of the wind from the radial velocity

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

vert_proj [Boolean] If true the vertical projection is computed. Otherwise the horizontal
projection is computed

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_Doppler.process_windshear (procstatus, dscfg, radar_list=None) Estimates the wind shear from the wind velocity

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

az_tol [float] The tolerance in azimuth when looking for gates on top of the gate when computation is performed

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad library reference for developers, Release 0.0.1				

PYRAD.PROC.PROCESS_ECHOCLASS

Functions for echo classification and filtering

process_echo_id(procstatus, dscfg[, radar_list])	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3:	
	Precipitation	
process_birds_id(procstatus, dscfg[, radar_list])	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3:	
	Birds	
<pre>process_clt_to_echo_id(procstatus, dscfg[,</pre>	Converts clutter exit code from rad4alp into pyrad echo	
])	ID	
<pre>process_echo_filter(procstatus, dscfg[,])</pre>	Masks all echo types that are not of the class specified	
	in keyword echo_type	
<pre>process_cdf(procstatus, dscfg[, radar_list])</pre>	Collects the fields necessary to compute the Cumulative	
	Distribution Function	
<pre>process_filter_snr(procstatus, dscfg[,])</pre>	filters out low SNR echoes	
<pre>process_filter_vel_diff(procstatus, dscfg[,</pre>	filters out range gates that could not be used for Doppler	
])	velocity estimation	
process_filter_visibility(procstatus,	filters out rays gates with low visibility and corrects the	
dscfg)	reflectivity	
<pre>process_outlier_filter(procstatus, dscfg[,</pre>	filters out gates which are outliers respect to the sur-	
])	rounding	
process_hydroclass(procstatus, dscfg[,])	Classifies precipitation echoes	
<pre>process_melting_layer(procstatus, dscfg[,</pre>	Detects the melting layer	
])		
process_zdr_column(procstatus, dscfg[,])	Detects ZDR columns	

pyrad.proc.process_echoclass.**process_birds_id**(procstatus, dscfg, radar_list=None) identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Birds

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
 dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [list of string. Dataset keyword] The input data types
 radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_echoclass.**process_cdf** (*procstatus*, *dscfg*, *radar_list=None*)

Collects the fields necessary to compute the Cumulative Distribution Function

Parameters procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords: datatype [list of string. Dataset keyword] The input data types radar list [list of Radar objects] Optional. list of radar objects Returns new_dataset [dict] dictionary containing the output ind_rad [int] radar index pyrad.proc.process_echoclass.process_clt_to_echo_id (procstatus, dscfg, radar list=None) Converts clutter exit code from rad4alp into pyrad echo ID **Parameters** procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords: datatype [list of string. Dataset keyword] The input data types radar list [list of Radar objects] Optional. list of radar objects Returns new_dataset [dict] dictionary containing the output ind rad [int] radar index pyrad.proc.process_echoclass.process_echo_filter(procstatus, dscfg, radar_list=None) Masks all echo types that are not of the class specified in keyword echo_type **Parameters** procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords: datatype [list of string. Dataset keyword] The input data types echo_type [int] The type of echo to keep: 1 noise, 2 clutter, 3 precipitation. Default 3 radar list [list of Radar objects] Optional. list of radar objects Returns new_dataset [dict] dictionary containing the output ind_rad [int] radar index pyrad.proc.process echoclass.process echo id(procstatus, dscfg, radar list=None) identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation **Parameters**

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
 dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [list of string. Dataset keyword] The input data types
 radar_list [list of Radar objects] Optional. list of radar objects

Returns

```
new_dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process_echoclass.process_filter_snr(procstatus, dscfg, radar_list=None)
     filters out low SNR echoes
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   SNRmin [float. Dataset keyword] The minimum SNR to keep the data.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process_echoclass.process_filter_vel_diff (procstatus,
                                                                                                    dscfg,
                                                                           radar list=None)
     filters out range gates that could not be used for Doppler velocity estimation
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   SNRmin [float. Dataset keyword] The minimum SNR to keep the data.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_echoclass.process_filter_visibility (procstatus,
                                                                                                    dscfg,
                                                                              radar list=None)
     filters out rays gates with low visibility and corrects the reflectivity
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   VISmin [float. Dataset keyword] The minimum visibility to keep the data.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
```

```
pyrad.proc.process_echoclass.process_hydroclass(procstatus, dscfg, radar_list=None) Classifies precipitation echoes
```

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

HYDRO_METHOD [string. Dataset keyword] The hydrometeor classification method. One of the following: SEMISUPERVISED

RADARCENTROIDS [string. Datset keyword] Used with HYDRO_METHOD SEMISUPERVISED. The name of the radar of which the derived centroids will be used. One of the following: A Albis, L Lema, P Plaine Morte, DX50

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind rad [int] radar index

Detects the melting layer

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

```
pyrad.proc.process_echoclass.process_outlier_filter(procstatus, radar list=None)
```

filters out gates which are outliers respect to the surrounding

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

threshold [float. Dataset keyword] The distance between the value of the examined range gate and the median of the surrounding gates to consider the gate an outlier

nb [int. Dataset keyword] The number of neighbours (to one side) to analyse. i.e. 2 would correspond to 24 gates

nb_min [int. Dataset keyword] Minimum number of neighbouring gates to consider the examined gate valid

percentile_min, percentile_max [float. Dataset keyword] gates below (above) these percentiles (computed over the sweep) are considered potential outliers and further examined

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad.proc.process_echoclass.process_zdr_column (procstatus, dscfg, radar_list=None)
 Detects ZDR columns

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
 dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [list of string. Dataset keyword] The input data types
 radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad library reference for developers, Release 0.0.1				

PYRAD.PROC.PROCESS INTERCOMP

Functions used in the inter-comparison between radars

<pre>process_time_avg(procstatus, dscfg[, radar_list])</pre>	computes the temporal mean of a field	
<pre>process_weighted_time_avg(procstatus,</pre>	computes the temporal mean of a field weighted by the	
dscfg)	reflectivity	
<pre>process_time_avg_flag(procstatus, dscfg[,</pre>	computes a flag field describing the conditions of the	
])	data used while averaging	
<pre>process_colocated_gates(procstatus, dscfg[,</pre>	Find colocated gates within two radars	
])		
<pre>process_intercomp(procstatus, dscfg[,])</pre>	intercomparison between two radars	
<pre>process_intercomp_time_avg(procstatus,</pre>	intercomparison between the average reflectivity of two	
dscfg)	radars	

pyrad.proc.process_intercomp.process_colocated_gates(procstatus, radar_list=None)

Find colocated gates within two radars

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

h_tol [float. Dataset keyword] Tolerance in altitude difference between radar gates [m]. Default 100.

latlon_tol [float. Dataset keyword] Tolerance in latitude and longitude position between radar gates [deg]. Default 0.0005

vol_d_tol [float. Dataset keyword] Tolerance in pulse volume diameter [m]. Default 100.

vismin [float. Dataset keyword] Minimum visibility [percent]. Default None.

hmin [float. Dataset keyword] Minimum altitude [m MSL]. Default None.

hmax [float. Dataset keyword] Maximum altitude [m MSL]. Default None.

rmin [float. Dataset keyword] Minimum range [m]. Default None.

rmax [float. Dataset keyword] Maximum range [m]. Default None.

elmin [float. Dataset keyword] Minimum elevation angle [deg]. Default None.

elmax [float. Dataset keyword] Maximum elevation angle [deg]. Default None.

azrad1min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 1. Default None.

azrad1max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 1. Default None.

azrad2min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 2. Default None.

azrad2max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 2. Default None.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [radar object] radar object containing the flag field
ind_rad [int] radar index

pyrad.proc.process_intercomp.process_intercomp (procstatus, dscfg, radar_list=None) intercomparison between two radars

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

coloc_data_dir [string. Dataset keyword] name of the directory containing the csv file with colocated data

coloc_radars_name [string. Dataset keyword] string identifying the radar names

azi_tol [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg

ele_tol [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5 deg

rng_tol [float. Dataset keyword] range tolerance between the two radars. Default 50 m
radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing a dictionary with intercomparison data and the key "final" which contains a boolean that is true when all volumes have been processed

ind rad [int] radar index

pyrad.proc.process_intercomp.process_intercomp_time_avg(procstatus, dscfg, radar_list=None)
intercomparison between the average reflectivity of two radars

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

coloc_data_dir [string. Dataset keyword] name of the directory containing the csv file with colocated data

coloc_radars_name [string. Dataset keyword] string identifying the radar names

```
azi_tol [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg
```

ele_tol [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5 deg

rng tol [float. Dataset keyword] range tolerance between the two radars. Default 50 m

clt_max [int. Dataset keyword] maximum number of samples that can be clutter contaminated. Default 100 i.e. all

phi_excess_max [int. Dataset keyword] maximum number of samples that can have excess instantaneous PhiDP. Default 100 i.e. all

non_rain_max [int. Dataset keyword] maximum number of samples that can be no rain.
Default 100 i.e. all

phi_avg_max [float. Dataset keyword] maximum average PhiDP allowed. Default 600 deg
 i.e. any

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing a dictionary with intercomparison data and the key "final" which contains a boolean that is true when all volumes have been processed

ind_rad [int] radar index

pyrad.proc.process_intercomp.process_time_avg(procstatus, dscfg, radar_list=None) computes the temporal mean of a field

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

period [float. Dataset keyword] the period to average [s]. Default 3600.

start_average [float. Dataset keyword] when to start the average [s from midnight UTC]. Default 0.

lin_trans: int. Dataset keyword If 1 apply linear transformation before averaging

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_intercomp.process_time_avg_flag(procstatus,

dscfg,

radar_list=None) computes a flag field describing the conditions of the data used while averaging

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

period [float. Dataset keyword] the period to average [s]. Default 3600.

```
start_average [float. Dataset keyword] when to start the average [s from midnight UTC].
                      Default 0.
                   phidpmax: float. Dataset keyword maximum PhiDP
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [Radar] radar object
               ind_rad [int] radar index
pyrad.proc.process_intercomp.process_weighted_time_avg (procstatus,
                                                                                                    dscfg,
                                                                              radar_list=None)
      computes the temporal mean of a field weighted by the reflectivity
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   period [float. Dataset keyword] the period to average [s]. Default 3600.
                   start average [float. Dataset keyword] when to start the average [s from midnight UTC].
                      Default 0.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [Radar] radar object
               ind_rad [int] radar index
```

PYRAD.PROC.PROCESS_MONITORING

Functions for monitoring of the polarimetric variables

$process_selfconsistency_kdp_phidp([,$	Computes specific differential phase and differential
])	phase in rain using the selfconsistency between Zdr, Zh
	and KDP
process_selfconsistency_bias(procstatus,	Estimates the reflectivity bias by means of the selfcon-
dscfg)	sistency algorithm by Gourley
<pre>process_estimate_phidp0(procstatus, dscfg[,</pre>	estimates the system differential phase offset at each ray
])	
process_rhohv_rain(procstatus, dscfg[,])	Keeps only suitable data to evaluate the 80 percentile of
	RhoHV in rain
process_zdr_precip(procstatus, dscfg[,])	Keeps only suitable data to evaluate the differential re-
	flectivity in moderate rain or precipitation (for vertical
	scans)
process_zdr_snow(procstatus, dscfg[, radar_list])	Keeps only suitable data to evaluate the differential re-
	flectivity in snow
process_monitoring(procstatus, dscfg[,])	computes monitoring statistics

pyrad.proc.process_monitoring.process_estimate_phidp0 (procstatus, dscfg, radar_list=None)
estimates the system differential phase offset at each ray

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] The minimum range where to look for valid data [m]

rmax [float. Dataset keyword] The maximum range where to look for valid data [m]

rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]

Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]

Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_monitoring.process_monitoring(procstatus, dscfg, radar_list=None)
 computes monitoring statistics

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

step [float. Dataset keyword] The width of the histogram bin. Default is None. In that case the default step in function get_histogram_bins is used

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [Radar] radar object containing histogram data

ind_rad [int] radar index

pyrad.proc.process_monitoring.process_rhohv_rain (procstatus, dscfg, radar_list=None)
Keeps only suitable data to evaluate the 80 percentile of RhoHV in rain

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation [dBZ]. Default 20.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipitation [dBZ] Default 40.

ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

Estimates the reflectivity bias by means of the selfconsistency algorithm by Gourley

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:datatype [list of string. Dataset keyword] The input data types

```
fzl [float. Dataset keyword] Default freezing level height. Default 2000.
                   rsmooth [float. Dataset keyword] length of the smoothing window [m]. Default 1000.
                   min_rhohv [float. Dataset keyword] minimum valid RhoHV. Default 0.92
                   max_phidp [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.
                   ml thickness [float. Dataset keyword] Melting layer thickness [m]. Default 700.
                   rcell [float. Dataset keyword] length of continuous precipitation to consider the precipita-
                      tion cell a valid phidp segment [m]. Default 1000.
                   dphidp_min [float. Dataset keyword] minimum phase shift [deg]. Default 2.
                   dphidp_max [float. Dataset keyword] maximum phase shift [deg]. Default 16.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process monitoring.process selfconsistency kdp phidp (procstatus,
                                                                                           dscfg,
                                                                                           radar list=None)
     Computes specific differential phase and differential phase in rain using the selfconsistency between Zdr, Zh
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of strings. Dataset keyword] The input data types
                   rsmooth [float. Dataset keyword] length of the smoothing window [m]. Default 1000.
                   min_rhohv [float. Dataset keyword] minimum valid RhoHV. Default 0.92
                   max_phidp [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.
                   ml_thickness [float. Dataset keyword] assumed melting layer thickness [m]. Default 700.
                   fzl [float. Dataset keyword] The default freezing level height. It will be used if no temper-
                     ature field name is specified or the temperature field is not in the radar object. Default
                      2000.
               radar list [list of Radar objects] Optional. list of radar objects
           Returns
               new dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_monitoring.process_zdr_precip(procstatus, dscfg, radar_list=None)
      Keeps only suitable data to evaluate the differential reflectivity in moderate rain or precipitation (for vertical
           Parameters
```

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

and KDP

scans)

datatype [list of string. Dataset keyword] The input data types

ml_filter [boolean. Dataset keyword] indicates if a filter on data in and above the melting layer is applied. Default True.

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation [dBZ]. Default 20.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipitation [dBZ] Default 22.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as precipitation Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as precipitation [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for precipitation [deg] Default None.

ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_monitoring.process_zdr_snow (procstatus, dscfg, radar_list=None)
Keeps only suitable data to evaluate the differential reflectivity in snow

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as snow [dBZ]. Default 0.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as snow [dBZ] Default 30.

SNRmin [float. Dataset keyword] minimum SNR to consider the bin as snow [dB]. Default 10.

SNRmax [float. Dataset keyword] maximum SNR to consider the bin as snow [dB] Default 50.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as snow Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as snow [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for snow [deg] Default None.

KDPmax [float. Dataset keyword] maximum KDP to consider the bin as snow [deg] Default None

TEMPmin [float. Dataset keyword] minimum temperature to consider the bin as snow [deg C]. Default None

TEMPmax [float. Dataset keyword] maximum temperature to consider the bin as snow [deg C] Default None

hydroclass [list of ints. Dataset keyword] list of hydrometeor classes to keep for the analysis Default [1] (dry snow)

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad library reference for developers, Release 0.0.1				

PYRAD.PROC.PROCESS_PHASE

Functions for PhiDP and KDP processing and attenuation correction

process_correct_phidp0(procstatus, dscfg[,	corrects phidp of the system phase

	tivity and differential reflectivity

 $\verb|pyrad.proc.process_phase.process_attenuation|| (\textit{procstatus}, \textit{dscfg}, \textit{radar_list=None})|$

Computes specific attenuation and specific differential attenuation using the Z-Phi method and corrects reflectivity and differential reflectivity

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

ATT_METHOD [float. Dataset keyword] The attenuation estimation method used. One of the following: ZPhi, Philin

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temper-

Returns

```
ature field name is specified or the temperature field is not in the radar object. Default
                     2000.
               radar_list [list of Radar objects] Optional. list of radar objects
               new dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process_phase.process_correct_phidp0 (procstatus, dscfg, radar_list=None)
     corrects phidp of the system phase
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
               radar list [list of Radar objects] Optional. list of radar objects
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_phase.process_kdp_leastsquare_double_window(procstatus,
                                                                                          radar_list=None)
     Computes specific differential phase using a piecewise least square method
                   rwinds [float. Dataset keyword] The length of the short segment for the least square method
```

Parameters

Returns

```
procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
    datatype [list of string. Dataset keyword] The input data types
    rwindl [float. Dataset keyword] The length of the long segment for the least square method
      [m]
    Zthr [float. Dataset keyword] The threshold defining which estimated data to use [dBZ]
radar_list [list of Radar objects] Optional. list of radar objects
```

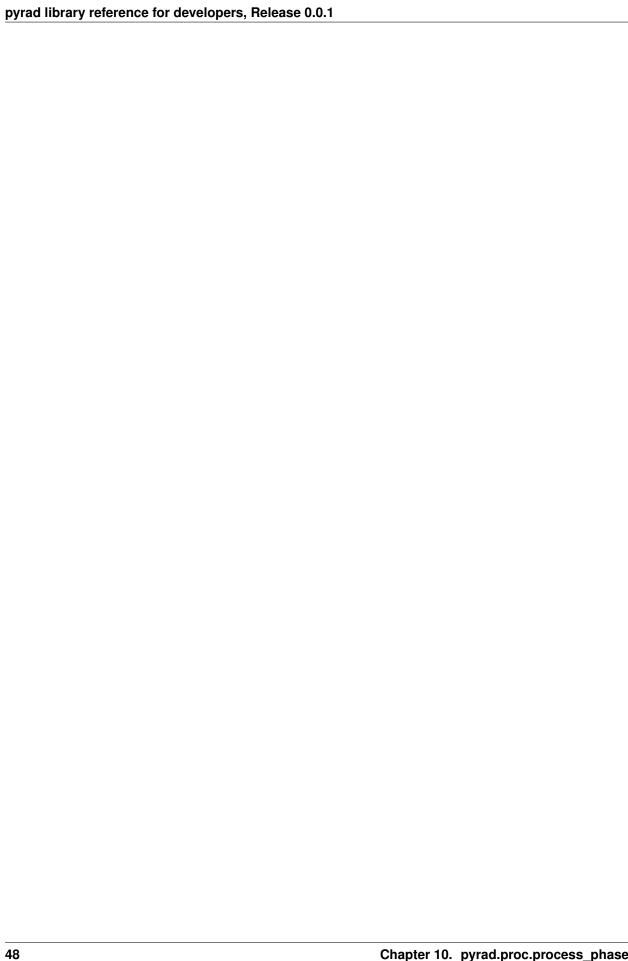

Returns

```
new_dataset [dict] dictionary containing the output
ind_rad [int] radar index
```

```
pyrad.proc.process phase.process kdp leastsquare single window(procstatus,
                                                                                          dscfg,
                                                                                          radar list=None)
     Computes specific differential phase using a piecewise least square method
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rwind [float. Dataset keyword] The length of the segment for the least square method [m]
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_phase.process_phidp_kdp_Kalman(procstatus,
                                                                                                    dscfg,
                                                                        radar_list=None)
     Computes specific differential phase and differential phase using the Kalman filter as proposed by Schneebeli et
     al. The data is assumed to be clutter free and continous
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   parallel [boolean. Dataset keyword] if set use parallel computing
                   get_phidp [boolean. Datset keyword] if set the PhiDP computed by integrating the resul-
                      tant KDP is added to the radar field
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_phase.process_phidp_kdp_Maesaka (procstatus,
                                                                                                    dscfg,
                                                                         radar_list=None)
     Estimates PhiDP and KDP using the method by Maesaka. This method only retrieves data in rain (i.e. below
     the melting layer)
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
```

```
Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
                   fzl [float. Dataset keyword] The freezing level height [m]. Default 2000.
                    ml_thickness [float. Dataset keyword] The melting layer thickness in meters. Default 700.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_phase.process_phidp_kdp_Vulpiani (procstatus,
                                                                                                      dscfg,
                                                                           radar list=None)
      Computes specific differential phase and differential phase using the method developed by Vulpiani et al. The
      data is assumed to be clutter free and monotonous
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                    rwind [float. Dataset keyword] The length of the segment [m]
                   n_iter [int. Dataset keyword] number of iterations
                   interp [boolean. Dataset keyword] if set non valid values are interpolated using neighbour-
                      ing valid values
                    parallel [boolean. Dataset keyword] if set use parallel computing
                    get_phidp [boolean. Datset keyword] if set the PhiDP computed by integrating the resul-
                      tant KDP is added to the radar field
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_phase.process_phidp_kdp_lp(procstatus, dscfg, radar_list=None)
      Estimates PhiDP and KDP using a linear programming algorithm. This method only retrieves data in rain (i.e.
      below the melting layer)
           Parameters
                procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   fzl [float. Dataset keyword] The freezing level height [m]. Default 2000.
                   ml_thickness [float. Dataset keyword] The melting layer thickness in meters. Default 700.
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
```

```
pyrad.proc.process_phase.process_smooth_phidp_double_window(procstatus,
                                                                                                    dscfg.
                                                                                     radar list=None)
     corrects phidp of the system phase and smoothes it using one window
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]
                   rwinds [float. Dataset keyword] The length of the short smoothing window [m]
                   rwindl [float. Dataset keyword] The length of the long smoothing window [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
                   Zthr [float. Dataset keyword] The threshold defining wich smoothed data to used [dBZ]
               radar list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process_phase.process_smooth_phidp_single_window (procstatus,
                                                                                                    dscfg,
                                                                                     radar_list=None)
     corrects phidp of the system phase and smoothes it using one window
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]
                   rwind [float. Dataset keyword] The length of the smoothing window [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
               radar list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind_rad [int] radar index
```

PYRAD.PROC.PROCESS_RETRIEVE

Functions for retrieving new moments and products

process_signal_power(procstatus, dscfg[,])	Computes the signal power in dBm
process_rcs_pr(procstatus, dscfg[, radar_list])	Computes the radar cross-section (assuming a point tar-
	get) from radar reflectivity by first computing the re-
	ceived power and then the RCS from it.
process_rcs(procstatus, dscfg[, radar_list])	Computes the radar cross-section (assuming a point tar-
	get) from radar reflectivity.
<pre>process_vol_refl(procstatus, dscfg[, radar_list])</pre>	Computes the volumetric reflectivity in 10log10(cm^2
	km^-3)
process_snr(procstatus, dscfg[, radar_list])	Computes SNR
<pre>process_1(procstatus, dscfg[, radar_list])</pre>	Computes L parameter
process_cdr(procstatus, dscfg[, radar_list])	Computes Circular Depolarization Ratio
<pre>process_rainrate(procstatus, dscfg[, radar_list])</pre>	Estimates rainfall rate from polarimetric moments
<pre>process_bird_density(procstatus, dscfg[,])</pre>	Computes the bird density from the volumetric reflec-
	tivity

pyrad.proc.process_retrieve.process_bird_density (procstatus, dscfg, radar_list=None)

Computes the bird density from the volumetric reflectivity

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [list of string. Dataset keyword] The input data types
 sigma_bird [float. Dataset keyword] The bird radar cross section
radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processingdscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

```
datatype [string. Dataset keyword] The input data type
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new_dataset [dict] dictionary containing the output
               ind rad [int] radar index
pyrad.proc.process retrieve.process 1 (procstatus, dscfg, radar list=None)
     Computes L parameter
           Parameters
               processing [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_retrieve.process_rainrate(procstatus, dscfg, radar_list=None)
     Estimates rainfall rate from polarimetric moments
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
                   RR_METHOD [string. Dataset keyword] The rainfall rate estimation method. One of the
                      following: Z, ZPoly, KDP, A, ZKDP, ZA, hydro
               radar_list [list of Radar objects] Optional. list of radar objects
           Returns
               new dataset [dict] dictionary containing the output
               ind_rad [int] radar index
pyrad.proc.process_retrieve.process_rcs (procstatus, dscfg, radar_list=None)
     Computes the radar cross-section (assuming a point target) from radar reflectivity.
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   kw2 [float. Dataset keyowrd] The water constant
                   pulse_width [float. Dataset keyowrd] The pulse width [s]
                   beamwidthv [float. Global keyword] The vertical polarization antenna beamwidth [deg].
                      Used if input is vertical reflectivity
```

beamwidthh [float. Global keyword] The horizontal polarization antenna beamwidth [deg]. Used if input is horizontal reflectivity

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind rad [int] radar index

pyrad.proc.process_retrieve.process_rcs_pr (procstatus, dscfg, radar_list=None)

Computes the radar cross-section (assuming a point target) from radar reflectivity by first computing the received power and then the RCS from it.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

antenna_gain [float. Global keyword] The antenna gain [dB]

txpwrv [float. Global keyword] The transmitted power of the vertical channel [dBm]. Used if input is vertical reflectivity

mflossv [float. Global keyword] The matching filter losses of the vertical channel. Used if input is vertical reflectivity

radconstv [float. Global keyword] The vertical channel radar constant. Used if input is vertical reflectivity

lrxv [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is vertical reflectivity

ltxv [float. Global keyword] The transmitter losses from the output of the high power amplifier to the antenna feed. [dB] positive value Used if input is vertical reflectivity

lradomev [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is vertical reflectivity

txpwrh [float. Global keyword] The transmitted power of the horizontal channel [dBm]. Used if input is horizontal reflectivity

mflossh [float. Global keyword] The matching filter losses of the vertical channel. Used if input is horizontal reflectivity

radconsth [float. Global keyword] The horizontal channel radar constant. Used if input is horizontal reflectivity

lrxh [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is horizontal reflectivity

ltxh [float. Global keyword] The transmitter losses from the output of the high power amplifier to the antenna feed. [dB] positive value Used if input is horizontal reflectivity

lradomeh [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is horizontal reflectivity

attg [float. Dataset keyword] The gas attenuation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

```
new_dataset [dict] dictionary containing the output
```

ind rad [int] radar index

pyrad.proc.process_retrieve.process_signal_power (procstatus, dscfg, radar_list=None)
Computes the signal power in dBm

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

mflossv [float. Global keyword] The matching filter losses of the vertical channel. Used if input is vertical reflectivity

radconstv [float. Global keyword] The vertical channel radar constant. Used if input is vertical reflectivity

lrxv [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is vertical reflectivity

lradomev [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is vertical reflectivity

mflossh [float. Global keyword] The matching filter losses of the vertical channel. Used if input is horizontal reflectivity

radconsth [float. Global keyword] The horizontal channel radar constant. Used if input is horizontal reflectivity

lrxh [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is horizontal reflectivity

lradomeh [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is horizontal reflectivity

attg [float. Dataset keyword] The gas attenuation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

```
new_dataset [dict] dictionary containing the output
```

ind_rad [int] radar index

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

output_type [string. Dataset keyword] The output data type. Either SNRh or SNRv

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.process_retrieve.**process_vol_refl** (procstatus, dscfg, radar_list=None) Computes the volumetric reflectivity in 10log10(cm^2 km^-3)

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
 datatype [list of string. Dataset keyword] The input data types
 freq [float. Dataset keyword] The radar frequency
 kw [float. Dataset keyword] The water constant
radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output
ind_rad [int] radar index

pyrad library reference for developers, Release 0.0.1				

PYRAD.PROC.PROCESS TIMESERIES

Functions to obtain time series of radar data

process_point_measurement(procstatus,	Obtains the radar data at a point location.
dscfg)	
process_qvp(procstatus, dscfg[, radar_list])	Computes quasi vertical profiles, by averaging over
	height levels PPI data.
process_rqvp(procstatus, dscfg[, radar_list])	Computes range defined quasi vertical profiles, by aver-
	aging over height levels PPI data.
process_evp(procstatus, dscfg[, radar_list])	Computes enhanced vertical profiles, by averaging over
	height levels PPI data.
process_svp(procstatus, dscfg[, radar_list])	Computes slanted vertical profiles, by averaging over
	height levels PPI data.
process_time_height(procstatus, dscfg[,])	Produces time height radar objects at a point of interest
	defined by latitude and longitude.

pyrad.proc.process_timeseries.**process_evp** (*procstatus*, *dscfg*, *radar_list=None*)
Computes enhanced vertical profiles, by averaging over height levels PPI data.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

lat, lon [float] latitude and longitude of the point of interest [deg]

latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005

delta_rng, **delta_azi** [float] maximum range distance [m] and azimuth distance [degree] from the central point of the evp containing data to average. Default 5000. and 10.

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 250.

avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default
"mean"

nvalid_min [int] Minimum number of valid points to consider the data valid when performing the averaging. Default 1

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none'. 'none' will select from all data points within the regular grid height

bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the EVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

pyrad.proc.process_timeseries.process_point_measurement(procstatus, dscfg, radar_list=None)

Obtains the radar data at a point location.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

lation [boolean. Dataset keyword] if True position is obtained from latitude, longitude information, otherwise position is obtained from antenna coordinates (range, azimuth, elevation).

truealt [boolean. Dataset keyword] if True the user input altitude is used to determine the point of interest. if False use the altitude at a given radar elevation ele over the point of interest.

lon [float. Dataset keyword] the longitude [deg]. Use when latlon is True.

lat [float. Dataset keyword] the latitude [deg]. Use when lation is True.

alt [float. Dataset keyword] altitude [m MSL]. Use when latlon is True.

ele [float. Dataset keyword] radar elevation [deg]. Use when latlon is False or when latlon is True and truealt is False

azi [float. Dataset keyword] radar azimuth [deg]. Use when latlon is False

rng [float. Dataset keyword] range from radar [m]. Use when latlon is False

AziTol [float. Dataset keyword] azimuthal tolerance to determine which radar azimuth to use [deg]

EleTol [float. Dataset keyword] elevation tolerance to determine which radar elevation to use [deg]

RngTol [float. Dataset keyword] range tolerance to determine which radar bin to use [m] **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the data and metadata at the point of interest
ind_rad [int] radar index

pyrad.proc.process_timeseries.**process_qvp** (procstatus, dscfg, radar_list=None)
Computes quasi vertical profiles, by averaging over height levels PPI data.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

angle [int or float] If the radar object contains a PPI volume, the sweep number to use, if it contains an RHI volume the elevation angle. Default 0.

ang_tol [float] If the radar object contains an RHI volume, the tolerance in the elevation angle for the conversion into PPI

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 50

avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default
"mean"

nvalid_min [int] Minimum number of valid points to accept average. Default 30.

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

pyrad.proc.process_timeseries.**process_rqvp** (procstatus, dscfg, radar_list=None)
Computes range defined quasi vertical profiles, by averaging over height levels PPI data.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

anglenr [int] The sweep number to use. It assumes the radar volume consists on PPI scans **hmax** [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 2.

avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"

nvalid_min [int] Minimum number of valid points to accept average. Default 30.

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest',
 etc. Default 'nearest' 'none' will select from all data points within the regular grid height
 bin the closest to the center of the bin. 'nearest' will select the closest data point to

the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

rmax [float] ground range up to which the data is intended for use [m]. Default 50000.

weight_power [float] Power p of the weighting function 1/abs(grng-(rmax-1))**p given to the data outside the desired range. -1 will set the weight to 0. Default 2.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

pyrad.proc.process_timeseries.**process_svp** (*procstatus*, *dscfg*, *radar_list=None*)
Computes slanted vertical profiles, by averaging over height levels PPI data.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

angle [int or float] If the radar object contains a PPI volume, the sweep number to use, if it contains an RHI volume the elevation angle. Default 0.

ang_tol [float] If the radar object contains an RHI volume, the tolerance in the elevation angle for the conversion into PPI

lat, lon [float] latitude and longitude of the point of interest [deg]

latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005

delta_rng, **delta_azi** [float] maximum range distance [m] and azimuth distance [degree] from the central point of the svp containing data to average. Default 5000. and 10.

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 250.

avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"

nvalid_min [int] Minimum number of valid points to consider the data valid when performing the averaging. Default 1

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the svp and a keyboard stating whether the processing has finished or not. ind_rad [int] radar index

pyrad.proc.process_timeseries.process_time_height (procstatus,

dscfg,

radar_list=None)

Produces time height radar objects at a point of interest defined by latitude and longitude. A time-height contains the evolution of the vertical structure of radar measurements above the location of interest.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

lat, lon [float] latitude and longitude of the point of interest [deg]

latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 50

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

THIRTEEN

PYRAD.PROC.PROCESS_TRAJ

Trajectory functions. Functions to pass trajectory dataset data to the product generation functions.

Return trajectory		
Processes data according to TRT trajectory		
Return time series according to lightning trajectory		
Return time series according to trajectory		
Process a new array of data volumes considering a plane		
trajectory.		
Get the time series values of a trajectory using a syn-		
thetic antenna pattern		
Find the gates of the radar object that have to be used to		
compute the data of a trajectory		
Find the gates of the radar object that belong to a TRT		
cell		
Find the gates of the radar object that have to be used to		
compute the data of a trajectory as seen by another radar		
system		
Get the radar bin closest to a certain trajectory position		
Check if trajectory sample is within radar sector		
A class for dummy target radar object		

```
\textbf{class} \texttt{ pyrad.proc.process\_traj.TargetRadar} (\textit{latitude}, \textit{longitude}, \textit{altitude})
```

Bases: object

A class for dummy target radar object

Return self==value.

Attributes

latitude, longitude, altitude [float] Position of the dummy radar

```
__class__
    alias of builtins.type
__delattr__($self, name, /)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.proc.process_traj', '__doc__': '\n A c
__dir__() \rightarrow list
    default dir() implementation
__eq__($self, value, /)
```

```
format__()
     default object formatter
___ge__ ($self, value, /)
     Return self>=value.
__getattribute__ ($self, name, /)
     Return getattr(self, name).
__gt___($self, value,/)
     Return self>value.
  _hash___($self,/)
     Return hash(self).
__init__(latitude, longitude, altitude)
     Initialize self. See help(type(self)) for accurate signature.
__init_subclass__()
     This method is called when a class is subclassed.
     The default implementation does nothing. It may be overridden to extend subclasses.
___le__ ($self, value, /)
     Return self<=value.
___lt___($self, value, /)
     Return self<value.
__module__ = 'pyrad.proc.process_traj'
__ne__ ($self, value, /)
     Return self!=value.
__new___($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
__reduce__()
     helper for pickle
___reduce_ex__()
     helper for pickle
__repr__($self,/)
     Return repr(self).
__setattr__($self, name, value,/)
     Implement setattr(self, name, value).
\_\_\mathtt{sizeof}\_\_() \rightarrow \mathrm{int}
     size of object in memory, in bytes
__str__($self,/)
     Return str(self).
subclasshook___()
     Abstract classes can override this to customize issubclass().
     This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImple-
     mented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal
     algorithm (and the outcome is cached).
  weakref
     list of weak references to the object (if defined)
```

```
pyrad.proc.process_traj._get_closests_bin (az, el, rr, tt, radar, tdict)

Get the radar bin closest to a certain trajectory position
```

Parameters

az, el, rr [floats] The trajectory position respect to the radar

tt [float] the trajectory time respect to the beginning of the radar scan

radar [radar object] the current radar object

tdict [dict] Dictionary containing trajectory parameters

Returns

radar_sel [radar object] The selected radar (Current or one of the two previous ones)

ray_sel, rr_ind [int] The selected ray and range indices of the radar field

el_vec_rnd, az_vec_rnd [array of floats] The elevation and azimuth fields of the selected radar rounded to the first decimal

pyrad.proc.process_traj._get_gates (radar, az, el, rr, tt, trajdict, ang_tol=1.2)

Find the gates of the radar object that have to be used to compute the data of a trajectory

Parameters

radar [radar object] The radar containing

az, el, rr [floats] The trajectory position respect to the radar

tt [float] the trajectory time respect to the beginning of the radar scan

trajdict [dict] Dictionary containing the trajectory parameters

ang_tol [float] Factor that multiplies the angle resolution. Used when determining the neighbouring rays

Returns

radar_sel [radar object] The radar volume selected as closest to trajectory point

ray_sel, rr_ind [ints] ray and range indices of the radar gate closest to the trajectory position

cell_ind [array of ints] indices of the surrounding rays

rr_min [int] index of the minimum range of the surrounding gates

rr max [int] index of the maximum range of the surrounding gates

```
pyrad.proc.process_traj._get_gates_antenna_pattern (radar_sel, target_radar, az, rr, tt, scan_angles, alt_tol=1000.0, latlon_tol=0.04, max\ altitude=12000.0)
```

Find the gates of the radar object that have to be used to compute the data of a trajectory as seen by another radar system

Parameters

radar_sel [radar object] The radar containing real data

target_radar [radar object] The virtual radar

az, rr [floats] The trajectory position respect to the radar

tt [float] the trajectory time respect to the beginning of the radar scan

scan_angles [array] The scan angles of the virtual radar object

alt_tol [float] The tolerance in altitude [m]

```
latlon_tol [float] The tolerance in latitude and longitude [deg]
               max_altitude [float] The maximum altitude where to look for radar data
           Returns
               ray ind, rng ind [array of ints] the indices of the radar data to use
               w ind [array of ints] The indices of the one-dimensional antenna pattern to use
pyrad.proc.process_traj._get_gates_trt (radar,
                                                                  trajectory,
                                                                                voltime,
                                                                                           time\_tol=100.0,
                                                        alt min=None, alt max=None)
     Find the gates of the radar object that belong to a TRT cell
           Parameters
               radar [radar object] The radar containing
               trajectory [trajectory object] Object containing the TRT cell position and dimensions
               voltime [datetime object] The radar volume reference time
               time_tol [float] Time tolerance where to look for data [s]
               alt_min, alt_max [float] Minimum and maximum altitude where to look for data [m]
           Returns
               inds ray, inds rng [array of ints] The indices of the radar data inside the TRT cell
pyrad.proc.process_traj._get_ts_values_antenna_pattern(radar, trajectory, tadict,
                                                                               traj ind, field names)
     Get the time series values of a trajectory using a synthetic antenna pattern
           Parameters
               radar [radar object] The radar volume with the data
               trajectory [trajectory object] The plane trajectory
               tadict [dict] A dictionary containing parameters useful for trajectory computation
               traj_ind [array] The indices of trajectory data within the current radar volume time
               field_names [list of str] list of names of the radar field
           Returns
               result [Bool] A flag signaling whether radar data matching the trajectory was found
pyrad.proc.process_traj._sample_out_of_sector(az, el, rr, radar_sel, ray_sel, rr_ind,
                                                                  el_vec_rnd, az_vec_rnd)
     Check if trajectory sample is within radar sector
           Parameters
               az, el, rr [floats] The trajectory position respect to the radar
               radar_sel [radar object] The selected radar (Current or one of the two previous ones)
               ray sel, rr ind [int] The selected ray and range indices of the radar field
               el vec rnd, az vec rnd [array of floats] The elevation and azimuth fields of the selected radar
                   rounded to the first decimal
           Returns
               result [bool] False if the sample is out of sector. True otherwise
```

Process a new array of data volumes considering a plane trajectory. As result a timeseries with the values transposed for a given antenna pattern is created. The result is created when the LAST flag is set.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing **dscfg** [dictionary of dictionaries]

datatype [list of string. Dataset keyword] The input data types

- **antennaType** [str. Dataset keyword] Type of antenna of the radar we want to get the view from. Can be AZIMUTH, ELEVATION, LOWBEAM, HIGHBEAM
- par_azimuth_antenna [dict. Global ekyword] Dictionary containing the parameters of the PAR azimuth antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle
- **par_elevation_antenna** [dict. Global keyword] Dictionary containing the parameters of the PAR elevation antenna, i.e. name of the file with the antenna azimuth pattern and fixed antenna angle
- asr_lowbeam_antenna [dict. Global keyword] Dictionary containing the parameters of the ASR low beam antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle
- **asr_highbeam_antenna** [dict. Global keyword] Dictionary containing the parameters of the ASR high beam antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle
- target_radar_pos [dict. Global keyword] Dictionary containing the latitude, longitude and altitude of the radar we want to get the view from. If not specifying it will assume the radar is collocated
- range_all [Bool. Dataset keyword] If the real radar and the synthetic radar are co-located and this parameter is true the statistics are going to be computed using all the data from range 0 to the position of the plane. Default False
- **rhi_resolution** [Bool. Dataset keyword] Resolution of the synthetic RHI used to compute the data as viewed from the synthetic radar [deg]. Default 0.5
- max_altitude [float. Dataset keyword] Max altitude of the data to use when computing the view from the synthetic radar [m MSL]. Default 12000.
- **lation_tol** [float. Dataset keyword] The tolerance in latitude and longitude to determine which synthetic radar gates are co-located with real radar gates [deg]. Default 0.04
- **alt_tol** [float. Datset keyword] The tolerance in altitude to determine which synthetic radar gates are co-located with real radar gates [m]. Default 1000.
- pattern_thres [float. Dataset keyword] The minimum of the sum of the weights given to each value in order to consider the weighted quantile valid. It is related to the number of valid data points
- data_is_log [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True)
 or linear units (False). Default False
- use_nans [dict. Dataset keyword] Dictionary specyfing whether the nans have to be used in the computation of the statistics for each field. Default False

```
nan value [dict. Dataset keyword] Dictionary with the value to use to substitute the NaN
                      values when computing the statistics of each field. Default 0
                radar list [list of Radar objects] Optional. list of radar objects
                trajectory [Trajectory object] containing trajectory samples
           Returns
                trajectory [Trajectory object] Object holding time series
                ind_rad [int] radar index
pyrad.proc.process_traj.process_traj_atplane (procstatus, dscfg, radar_list=None, trajec-
                                                                  tory=None)
      Return time series according to trajectory
           Parameters
                procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
                dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                    datatype [list of string. Dataset keyword] The input data types
                    data_is_log [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True)
                      or linear units (False). Default False
                    ang_tol [float. Dataset keyword] Factor that multiplies the angle resolution. Used when
                      determining the neighbouring rays. Default 1.2
                radar list [list of Radar objects] Optional. list of radar objects
                trajectory [Trajectory object] containing trajectory samples
           Returns
                trajectory [Trajectory object] Object holding time series
                ind_rad [int] radar index
pyrad.proc.process_traj.process_traj_lightning (procstatus, dscfg, radar_list=None, tra-
                                                                    jectory=None)
      Return time series according to lightning trajectory
           Parameters
                procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
                dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                    datatype [list of string. Dataset keyword] The input data types
                    data_is_log [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True)
                      or linear units (False). Default False
                    ang tol [float. Dataset keyword] Factor that multiplies the angle resolution. Used when
                      determining the neighbouring rays. Default 1.2
                radar_list [list of Radar objects] Optional. list of radar objects
                trajectory [Trajectory object] containing trajectory samples
```

Returns

trajectory [Trajectory object] Object holding time series
ind_rad [int] radar index

```
pyrad.proc.process_traj.process_traj_trt (procstatus,
                                                                      dscfg,
                                                                              radar list=None, trajec-
                                                         tory=None)
     Processes data according to TRT trajectory
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   time tol [float. Dataset keyword] tolerance between reference time of the radar volume
                     and that of the TRT cell [s]. Default 100.
                   alt_min, alt_max [float. Dataset keyword] Minimum and maximum altitude of the data
                     inside the TRT cell to retrieve [m MSL]. Default None
               radar_list [list of Radar objects] Optional. list of radar objects
               trajectory [Trajectory object] containing trajectory samples
           Returns
               trajectory [Trajectory object] Object holding time series
               ind rad [int] radar index
pyrad.proc.process_traj.process_trajectory(procstatus, dscfg, radar_list=None, trajec-
                                                            tory=None)
     Return trajectory
           Parameters
               procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
```

```
procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
    datatype [list of string. Dataset keyword] The input data types
radar_list [list of Radar objects] Optional. list of radar objects
trajectory [Trajectory object] containing trajectory samples
```

Returns

```
new_dataset [Trajectory object] radar object
ind_rad [int] None
```

pyrad library reference for develope	rs. Release 0.0.1		
, ,,			

68

FOURTEEN

PYRAD.PROD.PRODUCT_AUX

Auxiliary functions to generate products

get_prodgen_func(dsformat, dsname, dstype)

maps the dataset format into its processing function

pyrad.prod.product_aux.get_prodgen_func (dsformat, dsname, dstype) maps the dataset format into its processing function

Parameters

dsformat [str] dataset group, i.e. 'VOL', etc.

Returns

func [function] pyrad function used to generate the products

pyrad library reference for developers,	Release 0.0.1

FIFTEEN

PYRAD.PROD.PROCESS_PRODUCT

Functions for obtaining Pyrad products from the datasets

generate_occurrence_products(dataset, prd-	generates occurrence products
cfg)	
generate_cosmo_coord_products(dataset,	generates COSMO coordinates products
prdcfg)	
<pre>generate_sun_hits_products(dataset, prdcfg)</pre>	generates sun hits products
<pre>generate_qvp_products(dataset, prdcfg)</pre>	Generates quasi vertical profile products.
<pre>generate_ml_products(dataset, prdcfg)</pre>	Generates melting layer products.

pyrad.prod.process_product.generate_cosmo_coord_products (dataset, prdcfg)
 generates COSMO coordinates products

Parameters

dataset [tuple] radar object containing the COSMO coordinates

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

filename [str] the name of the file created. None otherwise

pyrad.prod.process_product.generate_ml_products(dataset, prdcfg)
Generates melting layer products.

Parameters

dataset [dict] dictionary containing the radar object and a keyword stating the status of the processing

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

filename [str] the name of the file created. None otherwise

Parameters

dataset [tuple] radar object and metadata dictionary

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

pyrad.prod.process_product.generate_qvp_products(dataset, prdcfg)

Generates quasi vertical profile products. Quasi vertical profiles come from azimuthal averaging of polarimetric radar data.

Parameters

dataset [dict] dictionary containing the radar object and a keyword stating the status of the processing

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

filename [str] the name of the file created. None otherwise

Parameters

dataset [tuple] radar object and sun hits dictionary

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

SIXTEEN

PYRAD.PROD.PROCESS_VOL_PRODUCTS

Functions for obtaining Pyrad products from a radar volume dataset

generate_vol_products(dataset, prdcfg)

Generates radar volume products.

pyrad.prod.process_vol_products.generate_vol_products (dataset, prdcfg)
Generates radar volume products.

Parameters

dataset [dict] dictionary with key radar_out containing a radar object

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

no return

pyrad library reference for developers,	Release 0.0.1

SEVENTEEN

PYRAD.PROD.PROCESS_GRID_PRODUCTS

Functions for obtaining Pyrad products from gridded datasets

generate_grid_products(dataset, prdcfg)

generates grid products

Parameters

dataset [grid] grid object

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

no return

Parameters

dataset [dictionary containing the points and their values]

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

no return

EIGHTEEN

PYRAD.PROD.PROCESS_TIMESERIES_PRODUCTS

Functions for obtaining Pyrad products from a time series datasets

```
generate_timeseries_products(dataset, prd- Generates time series products
cfg)
```

Generates time series products

Parameters

dataset [dictionary] radar object

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

no return

NINETEEN

PYRAD.PROD.PROCESS_MONITORING_PRODUCTS

Functions for obtaining Pyrad products from monitoring datasets

generate_monitoring_products(dataset, prd- generates a monitoring product
cfg)

Parameters

dataset [dictionary] dictionary containing a histogram object and some metadataprdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

PYRAD.PROD.PROCESS INTERCOMP PRODUCTS

Functions for obtaining Pyrad products from datasets used in the intercomparison process

Returns

```
generate intercomp products(dataset, prd-
                                                     Generates radar intercomparison products.
 generate_colocated_gates_products(dataset, Generates colocated gates products
                                                    generates time average products
 generate_time_avg_products(dataset, prdcfg)
pyrad.prod.process_intercomp_products.generate_colocated_gates_products(dataset,
                                                                                               cfg)
     Generates colocated gates products
          Parameters
              dataset [tuple] radar objects and colocated gates dictionary
              prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries
          Returns
              filename [str] the name of the file created. None otherwise
pyrad.prod.process_intercomp_products.generate_intercomp_products(dataset,
                                                                                       prdcfg)
     Generates radar intercomparison products.
          Parameters
              dataset [tuple] values of colocated gates dictionary
              prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries
          Returns
              filename [str] the name of the file created. None otherwise
pyrad.prod.process_intercomp_products.generate_time_avg_products(dataset, prd-
                                                                                      cfg)
     generates time average products
          Parameters
              dataset [tuple] radar objects and colocated gates dictionary
              prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries
```

TWENTYONE

PYRAD.PROD.PROCESS_PRODUCT

Functions for obtaining Pyrad products from the datasets

generate_traj_product(traj, prdcfg)

Generates trajectory products

pyrad.prod.process_traj_products.generate_traj_product (traj, prdcfg)
 Generates trajectory products

Parameters

traj [Trajectory object]

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

None

pyrad library reference for developers, Release 0.0.1		

TWENTYTWO

PYRAD.IO.IO_AUX

Auxiliary functions for reading/writing files

map_hydro(hydro_data_op)	maps the operational hydrometeor classification identi-	
	fiers to the ones used by Py-ART	
map_Doppler(Doppler_data_bin, Nyquist_vel)	maps the binary METRANET Doppler data to actual	
	Doppler velocity	
<pre>get_save_dir(basepath, procname, dsname, prd-</pre>	obtains the path to a product directory and eventually	
name)	creates it	
<pre>make_filename(prdtype, dstype, dsname, ext_list)</pre>	creates a product file name	
<pre>generate_field_name_str(datatype)</pre>	Generates a field name in a nice to read format.	
<pre>get_datatype_metranet(datatype)</pre>	maps de config file radar data type name into the cor-	
	responding metranet data type name and Py-ART field	
	name	
<pre>get_datatype_odim(datatype)</pre>	maps the config file radar data type name into the corre-	
	sponding odim data type name and Py-ART field name	
<pre>get_fieldname_pyart(datatype)</pre>	maps the config file radar data type name into the corre-	
	sponding rainbow Py-ART field name	
<pre>get_fieldname_cosmo(field_name)</pre>	maps the Py-ART field name into the corresponding	
	COSMO variable name	
get_field_unit(datatype)	Return unit of datatype.	
<pre>get_field_name(datatype)</pre>	Return long name of datatype.	
<pre>get_file_list(datadescriptor, starttime,)</pre>	gets the list of files with a time period	
<pre>get_trtfile_list(datapath, starttime, endtime)</pre>	gets the list of TRT files with a time period	
<pre>get_scan_list(scandescriptor_list)</pre>	determine which is the scan list for each radar	
<pre>get_new_rainbow_file_name(master_fname,</pre>	get the rainbow file name containing datatype from a	
)	master file name and data type	
<pre>get_datatype_fields(datadescriptor)</pre>	splits the data type descriptor and provides each individ-	
	ual member	
<pre>get_dataset_fields(datasetdescr)</pre>	splits the dataset type descriptor and provides each indi-	
	vidual member	
get_datetime(fname, datadescriptor)	Given a data descriptor gets date and time from file	
	name	
find_raw_cosmo_file(voltime, datatype, cfg)	Search a COSMO file in netcdf format	
find_cosmo_file(voltime, datatype, cfg, scanid)	Search a COSMO file in Rainbow format	
<pre>find_hzt_file(voltime, cfg[, ind_rad])</pre>	Search an ISO-0 degree file in HZT format	
<pre>find_rad4alpcosmo_file(voltime, datatype,</pre>	Search a COSMO file	
)		
_get_datetime(fname, datagroup[, ftime_format])	Given a data group gets date and time from file name	

 $\verb"pyrad.io.io_aux._{\verb"get_datetime"}(\textit{fname}, \textit{datagroup}, \textit{ftime_format=None})$

```
Given a data group gets date and time from file name
```

Parameters

fname [str] file name

datadescriptor [str] radar field type. Format : [radar file type]:[datatype]

ftime format [str or None] if the file is of type ODIM this contain the file time format

Returns

fdatetime [datetime object] date and time in file name

pyrad.io.io_aux.find_cosmo_file (voltime, datatype, cfg, scanid, ind_rad=0)
Search a COSMO file in Rainbow format

Parameters

voltime [datetime object] volume scan time

datatype [str] type of COSMO data to look for

cfg [dictionary of dictionaries] configuration info to figure out where the data is

scanid [str] name of the scan

ind_rad [int] radar index

Returns

fname [str] Name of COSMO file if it exists. None otherwise

 $\verb"pyrad.io.io_aux.find_hzt_file" (\textit{voltime}, \textit{cfg}, \textit{ind}_\textit{rad} = 0)$

Search an ISO-0 degree file in HZT format

Parameters

voltime [datetime object] volume scan time

cfg [dictionary of dictionaries] configuration info to figure out where the data is

ind_rad [int] radar index

Returns

fname [str] Name of HZT file if it exists. None otherwise

pyrad.io.io_aux.find_rad4alpcosmo_file (voltime, datatype, cfg, scanid, ind_rad=0)
Search a COSMO file

Parameters

voltime [datetime object] volume scan time

datatype [str] type of COSMO data to look for

cfg: dictionary of dictionaries configuration info to figure out where the data is

ind_rad: int radar index

Returns

fname [str] Name of COSMO file if it exists. None otherwise

scanid: str name of the scan

pyrad.io.io_aux.find_raw_cosmo_file (voltime, datatype, cfg, ind_rad=0)

Search a COSMO file in netcdf format

```
Parameters
               voltime [datetime object] volume scan time
               datatype [str] type of COSMO data to look for
               cfg [dictionary of dictionaries] configuration info to figure out where the data is
               ind rad [int] radar index
           Returns
               fname [str] Name of COSMO file if it exists. None otherwise
pyrad.io.io_aux.generate_field_name_str(datatype)
     Generates a field name in a nice to read format.
           Parameters
               datatype [str] The data type
           Returns
               field str [str] The field name
pyrad.io.io aux.get dataset fields(datasetdescr)
     splits the dataset type descriptor and provides each individual member
           Parameters
               datasetdescr [str] dataset type. Format : [processing level]:[dataset type]
           Returns
               proclevel [str] dataset processing level
               dataset [str] dataset type, i.e. dBZ, ZDR, ISO0, ...
pyrad.io.io_aux.get_datatype_fields (datadescriptor)
     splits the data type descriptor and provides each individual member
           Parameters
               datadescriptor [str] radar field type. Format : [radar file type]:[datatype]
           Returns
               radarnr [str] radar number, i.e. RADAR1, RADAR2, ...
               datagroup [str] data type group, i.e. RAINBOW, RAD4ALP, ODIM, CFRADIAL, COSMO,
                   MXPOL ...
               datatype [str] data type, i.e. dBZ, ZDR, ISO0, ...
               dataset [str] dataset type (for saved data only)
               product [str] product type (for saved data only)
```

maps de config file radar data type name into the corresponding metranet data type name and Py-ART field

Parameters

name

datatype [str] config file radar data type name

pyrad.io.io_aux.get_datatype_metranet (datatype)

Returns

```
metranet type [dict] dictionary containing the metranet data type name and its corresponding
                  Py-ART field name
pyrad.io.io_aux.get_datatype_odim(datatype)
     maps the config file radar data type name into the corresponding odim data type name and Py-ART field name
          Parameters
              datatype [str] config file radar data type name
          Returns
              metranet type [dict] dictionary containing the odim data type name and its corresponding Py-
                  ART field name
pyrad.io.io_aux.get_datetime(fname, datadescriptor)
     Given a data descriptor gets date and time from file name
          Parameters
              fname [str] file name
              datadescriptor [str] radar field type. Format : [radar file type]:[datatype]
          Returns
              fdatetime [datetime object] date and time in file name
pyrad.io.io_aux.get_field_name (datatype)
     Return long name of datatype.
          Parameters
              datatype [str] The data type
          Returns
              name [str] The name
pyrad.io.io_aux.get_field_unit (datatype)
     Return unit of datatype.
          Parameters
              datatype [str] The data type
          Returns
              unit [str] The unit
pyrad.io.io_aux.get_fieldname_cosmo (field_name)
     maps the Py-ART field name into the corresponding COSMO variable name
          Parameters
              field_name [str] Py-ART field name
          Returns
              cosmo_name [str] Py-ART variable name
pyrad.io.io_aux.get_fieldname_pyart (datatype)
     maps the config file radar data type name into the corresponding rainbow Py-ART field name
          Parameters
              datatype [str] config file radar data type name
          Returns
```

```
field_name [str] Py-ART field name
pyrad.io.io_aux.get_file_list (datadescriptor, starttime, endtime, cfg, scan=None)
     gets the list of files with a time period
           Parameters
               datadescriptor [str] radar field type. Format : [radar file type]:[datatype]
               startime [datetime object] start of time period
               endtime [datetime object] end of time period
               cfg: dictionary of dictionaries configuration info to figure out where the data is
               scan [str] scan name
           Returns
               filelist [list of strings] list of files within the time period
pyrad.io.io_aux.get_new_rainbow_file_name (master_fname,
                                                                                   master_datadescriptor,
     get the rainbow file name containing datatype from a master file name and data type
           Parameters
               master fname [str] the master file name
               master_datadescriptor [str] the master data type descriptor
               datatype [str] the data type of the new file name to be created
           Returns
               new_fname [str] the new file name
                                                     procname,
                                                                                          timeinfo=None,
pyrad.io.io_aux.get_save_dir(basepath,
                                                                   dsname,
                                                                              prdname,
                                         timeformat='%Y-%m-%d', create_dir=True)
     obtains the path to a product directory and eventually creates it
           Parameters
               basepath [str] product base path
               procname [str] name of processing space
               dsname [str] data set name
               prdname [str] product name
               timeinfo [datetime] time info to generate the date directory. If None there is no time format in
                   the path
               timeformat [str] Optional. The time format.
               create_dir [boolean] If True creates the directory
           Returns
               savedir [str] path to product
pyrad.io.io_aux.get_scan_list(scandescriptor_list)
     determine which is the scan list for each radar
           Parameters
               scandescriptor [list of string] the list of all scans for all radars
           Returns
```

```
scan_list [list of lists] the list of scans corresponding to each radar
pyrad.io.io_aux.get_trtfile_list (datapath, starttime, endtime)
     gets the list of TRT files with a time period
           Parameters
               datapath [str] directory where to look for data
               startime [datetime object] start of time period
               endtime [datetime object] end of time period
           Returns
               filelist [list of strings] list of files within the time period
pyrad.io.io_aux.make_filename(prdtype, dstype, dsname, ext_list, prdcfginfo=None, time-
                                          info=None, timeformat='%Y%m%d%H%M%S', runinfo=None)
     creates a product file name
           Parameters
               timeinfo [datetime] time info to generate the date directory
               prdtype [str] product type, i.e. 'ppi', etc.
               dstype [str] data set type, i.e. 'raw', etc.
               dsname [str] data set name
               ext_list [list of str] file name extensions, i.e. 'png'
               prdcfginfo [str] Optional. string to add product configuration information, i.e. 'el0.4'
               timeformat [str] Optional. The time format
               runinfo [str] Optional. Additional information about the test (e.g. 'RUN01', 'TS011')
           Returns
               fname_list [list of str] list of file names (as many as extensions)
pyrad.io.io_aux.map_Doppler(Doppler_data_bin, Nyquist_vel)
     maps the binary METRANET Doppler data to actual Doppler velocity
           Parameters
               Doppler_data_bin [numpy array] The binary METRANET data
           Returns
               Doppler_data [numpy array] The Doppler veloctiy in [m/s]
pyrad.io.io_aux.map_hydro(hydro_data_op)
     maps the operational hydrometeor classification identifiers to the ones used by Py-ART
           Parameters
               hydro_data_op [numpy array] The operational hydrometeor classification data
           Returns
               hydro_data_py [numpy array] The pyart hydrometeor classification data
```

TWENTYTHREE

PYRAD.IO.CONFIG

Functions for reading pyrad config files

read_config(fname[, cfg])	Read a pyrad config file.
<pre>get_num_elements(dtype, nelstr)</pre>	Checks if data type is an array or a structure.
string_to_datatype(dtype, strval)	Converts a string containing a value into its Python
	value
get_array(cfgfile, pos, nel, valtype)	reads an array in a config file
get_struct(cfgfile, pos, nels, fname)	reads an struct in a config file
get_array_type(dtype)	Determines Python array type from the config file array
	type
<pre>init_array(nel, dtype)</pre>	Initializes a Python array

```
pyrad.io.config.get_array (cfgfile, pos, nel, valtype)
    reads an array in a config file
```

Parameters

cfgfile [file object] config file

pos [int] position in file object

nel [int] number of elements of the ray

valtype [str] type of array

Returns

arr [array] array values

newpos [int] new position in file object

pyrad.io.config.get_array_type(dtype)

Determines Python array type from the config file array type

Parameters

dtype [str] config file data type

Returns

pytype [str] Python array type

pyrad.io.config.get_num_elements (dtype, nelstr)

Checks if data type is an array or a structure.

Parameters

dtype [str] data type specifier

```
nelstr [str] number of elements
           Returns
               nel [int] number of elements if type is *ARR or STRUCT. 0 otherwise
               isstruct [bool] true if the type is STRUCT
pyrad.io.config.get_struct (cfgfile, pos, nels, fname)
     reads an struct in a config file
           Parameters
               cfgfile [file object] config file
               pos [int] position in file object
               nel [int] number of elements of the ray
               fname [str] config file name
           Returns
               struct [dict] dictionary of struct values
               newpos [int] new position in file object
pyrad.io.config.init_array(nel, dtype)
     Initializes a Python array
           Parameters
               nel [int] number of elements in the array
               dtype [str] config file data type
           Returns
               pyarr [array] Python array
pyrad.io.config.read_config(fname, cfg=None)
     Read a pyrad config file.
           Parameters
               fname [str] Name of the configuration file to read.
               cfg [dict of dicts, optional] dictionary of dictionaries containing configuration parameters where
                   the new parameters will be placed
           Returns
               cfg [dict of dicts] dictionary of dictionaries containing the configuration parameters
pyrad.io.config.string_to_datatype(dtype, strval)
     Converts a string containing a value into its Python value
           Parameters
               dtype [str] data type specifier
               strval [str] string value
           Returns
               val [scalar] value contained in the string
```

TWENTYFOUR

PYRAD.IO.READ_DATA_RADAR

Functions for reading radar data files

get_data(voltime, datatypesdescr, cfg)	Reads pyrad input data.	
merge_scans_rainbow(basepath, scan_list,)	merge rainbow scans	
merge_scans_dem(basepath, scan_list,)	merge rainbow scans	
merge_scans_rad4alp(basepath, scan_list,)	merge rad4alp data.	
merge_scans_odim(basepath, scan_list,[,])	merge odim data.	
merge_scans_cosmo(voltime, datatype_list, cfg)	merge rainbow scans	
merge_scans_cosmo_rad4alp(voltime,	merge cosmo rad4alp scans.	
datatype, cfg)		
merge_scans_dem_rad4alp(voltime, datatype,	merge DEM rad4alp scans.	
cfg)		
merge_scans_hydro_rad4alp(voltime,	merge rad4alp hydrometeor classification scans.	
datatype, cfg)		
<pre>merge_fields_rainbow(basepath, scan_name,</pre>	merge Rainbow fields into a single radar object.	
)		
merge_fields_cfradial(basepath, loadname,	merge CF/Radial fields into a single radar object.	
)		
<pre>merge_fields_dem(basepath, scan_name,)</pre>	merge DEM fields into a single radar object.	
merge_fields_cosmo(filename_list)	merge COSMO fields in Rainbow file format	
<pre>get_data_rainbow(filename, datatype)</pre>	gets rainbow radar data	
<pre>get_data_rad4alp(filename, datatype_list,)</pre>	gets rad4alp radar data	
<pre>get_data_odim(filename, datatype_list,)</pre>	gets ODIM radar data	
add_field(radar_dest, radar_orig)	adds the fields from orig radar into dest radar.	
<pre>interpol_field(radar_dest, radar_orig,)</pre>	interpolates field field_name contained in radar_orig to	
	the grid in radar_dest	

pyrad.io.read_data_radar.add_field(radar_dest, radar_orig)

adds the fields from orig radar into dest radar. If they are not in the same grid, interpolates them to dest grid

Parameters

radar_dest [radar object] the destination radar

radar_orig [radar object] the radar object containing the original field

Returns

field_dest [dict] interpolated field and metadata

pyrad.io.read_data_radar.get_data(voltime, datatypesdescr, cfg)
 Reads pyrad input data.

```
Parameters
               voltime [datetime object] volume scan time
               datatypesdescr [list] list of radar field types to read. Format : [radar file type]:[datatype]
               cfg: dictionary of dictionaries configuration info to figure out where the data is
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.get_data_mxpol (filename, datatype_list)
     gets MXPol radar data
           Parameters
               filename [str] name of file containing MXPol data
               datatype_list [list of strings] list of data fields to get
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.get_data_odim (filename, datatype_list, scan_name, cfg, ind_rad=0)
     gets ODIM radar data
           Parameters
               filename [str] name of file containing odim data
               datatype list [list of strings] list of data fields to get
               scan_name [str] name of the elevation (001 to 020)
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object. None if the reading has not been successful
pyrad.io.read_data_radar.get_data_rad4alp(filename,
                                                                       datatype_list,
                                                                                       scan_name,
                                                                                                     cfg,
                                                           ind rad=0
     gets rad4alp radar data
           Parameters
               filename [str] name of file containing rainbow data
               datatype_list [list of strings] list of data fields to get
               scan_name [str] name of the elevation (001 to 020)
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object. None if the reading has not been successful
pyrad.io.read_data_radar.get_data_rainbow(filename, datatype)
     gets rainbow radar data
           Parameters
               filename [str] name of file containing rainbow data
```

```
datatype [str] field name
           Returns
               radar [Radar] radar object
                                                                                              field name,
pyrad.io.read_data_radar.interpol_field(radar_dest,
                                                                           radar_orig,
                                                        fill\_value=None, ang\_tol=0.5)
     interpolates field field_name contained in radar_orig to the grid in radar_dest
           Parameters
               radar dest [radar object] the destination radar
               radar_orig [radar object] the radar object containing the original field
               field_name: str name of the field to interpolate
               fill_value: float The fill value
               ang_tol [float] angle tolerance to determine whether the radar origin sweep is the radar destina-
                   tion sweep
           Returns
               field dest [dict] interpolated field and metadata
pyrad.io.read data radar.merge fields cfradial (basepath,
                                                                                  loadname.
                                                                                                  voltime.
                                                                   datatype_list, dataset_list, product_list,
                                                                   rmax=0.0)
     merge CF/Radial fields into a single radar object.
           Parameters
               basepath [str] name of the base path where to find the data
               loadname: str name of the saving directory
               voltime [datetime object] reference time of the scan
               datatype_list [list] list of data types to get
               dataset_list [list] list of datasets that produced the data type to get. Used to get path.
               product list [list] list of products. Used to get path
               rmax [float] maximum range that will be kept.
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_fields_cosmo (filename_list)
     merge COSMO fields in Rainbow file format
           Parameters
               filename_list [str] list of file paths where to find the data
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_fields_dem(basepath, scan_name, datatype_list)
     merge DEM fields into a single radar object.
           Parameters
```

basepath [str] name of the base path where to find the data

95

```
scan name: str name of the scan
               datatype_list [list] lists of data types to get
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_fields_rainbow(basepath,
                                                                                                voltime.
                                                                               scan name,
                                                                datatype_list)
     merge Rainbow fields into a single radar object.
           Parameters
               basepath [str] name of the base path where to find the data
               scan_name: str name of the scan
               voltime [datetime object] reference time of the scan
               datatype_list [list] lists of data types to get
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_Doppler_rad4alp(voltime,
                                                                                      datatype,
                                                                                                    cfg,
     merge rad4alp dealised Doppler velocity scans. If data for all the scans cannot be retrieved returns None
           Parameters
               voltime: datetime object reference time of the scan
               datatype [str] name of the data type to read
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_cosmo (voltime, datatype_list, cfg, ind_rad=0)
     merge rainbow scans
           Parameters
               voltime: datetime object reference time of the scan
               datatype list [list] lists of data types to get
               cfg [dict] configuration dictionary
               ind rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_cosmo_rad4alp(voltime,
                                                                                    datatype,
                                                                                                    cfg,
                                                                       ind rad=0
     merge cosmo rad4alp scans. If data for all the scans cannot be retrieved returns None
           Parameters
               voltime: datetime object reference time of the scan
               datatype [str] name of the data type to read
```

```
cfg [dict] configuration dictionary
               ind rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read data radar.merge scans dem (basepath, scan list, datatype list)
     merge rainbow scans
           Parameters
               basepath [str] base path of rad4alp radar data
               scan list [list] list of scans
               datatype_list [list] lists of data types to get
               radarnr [str] radar identifier number
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_dem_rad4alp(voltime, datatype, cfg, ind_rad=0)
     merge DEM rad4alp scans. If data for all the scans cannot be retrieved returns None
           Parameters
               voltime: datetime object reference time of the scan
               datatype [str] name of the data type to read
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_hydro_rad4alp(voltime,
                                                                                     datatype,
                                                                                                    cfg,
                                                                       ind rad=0)
     merge rad4alp hydrometeor classification scans. If data for all the scans cannot be retrieved returns None
           Parameters
               voltime: datetime object reference time of the scan
               datatype [str] name of the data type to read
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_mxpol(basepath, scan_list, voltime, datatype_list,
                                                            cfg)
     merge rad4alp data.
           Parameters
               basepath [str] base path of mxpol radar data
               scan_list [list] list of scans, in the case of mxpol, the elevation or azimuth denoted as 005 or
                   090 (for 5 or 90 degrees elevation) or 330 (for 330 degrees azimuth respectively)
```

```
voltime: datetime object reference time of the scan
               datatype_list [list] lists of data types to get
               cfg [dict] configuration dictionary
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_odim(basepath, scan_list, radar_name, radar_res,
                                                           voltime,
                                                                      datatype_list, dataset_list,
                                                           ind\_rad=0)
     merge odim data.
           Parameters
               basepath [str] base path of odim radar data
               scan_list [list] list of scans (h5)
               voltime: datetime object reference time of the scan
               datatype_list [list] lists of data types to get
               dataset_list [list] list of datasets. Used to get path
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_rad4alp(basepath,
                                                                              scan list,
                                                                                            radar name,
                                                               radar_res, voltime, datatype_list, cfg,
                                                               ind rad=0)
     merge rad4alp data.
           Parameters
               basepath [str] base path of rad4alp radar data
               scan_list [list] list of scans (001 to 020)
               radar_name [str] radar_name (A, D, L, ...)
               radar_res [str] radar resolution (H or L)
               voltime: datetime object reference time of the scan
               datatype list [list] lists of data types to get
               cfg [dict] configuration dictionary
               ind_rad [int] radar index
           Returns
               radar [Radar] radar object
pyrad.io.read_data_radar.merge_scans_rainbow (basepath, scan_list, voltime, scan_period,
                                                               datatype_list, cfg, radarnr='RADAR001')
     merge rainbow scans
           Parameters
               basepath [str] base path of rad4alp radar data
```

```
scan_list [list] list of scans

voltime: datetime object reference time of the scan
scan_period [float] time from reference time where to look for other scans data
datatype_list [list] lists of data types to get
cfg [dict] configuration dictionary
radarnr [str] radar identifier number
Returns
radar [Radar] radar object
```

pyrad library reference for developers, Release 0.0.1	

TWENTYFIVE

PYRAD.IO.READ DATA MXPOL

Functions for reading radar mxpol data files .. autosummary:

```
:toctree: generated/
classes - MXPOL:
   pyrad_MXPOL
classes - MCH:
   pyrad_MCH
utilities - read:
   row_stack
   findTimes
   int2float_radar
    readMXPOLRadData
    readCHRadData
utilities - config:
    load_myconfig
   get_mymetadata
   get_elevation_metadata
    generate_radar_table
    generate_polvar_metadata
    convert_polvar_name
```

pyrad.io.read_data_mxpol.convert_polvar_name (convention, polvar)

toolbox context

```
pyrad.io.read_data_mxpol.findTimes(num_sweep)
```

Finds the times at the beginning and at the end of each sweep. Information comes from the elapsed time since the beginning of the volume scan, from the Rad4Alp: Specifications/ Request for Proposal (RFP) document. Inputs —— num_sweep: int

rank of the sweep

elapsed_times[num_sweep][0]: float the elapsed time since the beginning of the volume scan at the beginning
 of the sweep

elapsed_times[num_sweep][1]: float the elapsed time since the beginning of the volume scan at the end of the sweep

polatimetric variable of interest

```
filename: str Filename of the configuration file. If None the default configuration file is loaded from the direc-
           tory.
     polvar metadata: dict dictionary with metadata for polarimetric variable of interest
pyrad.io.read_data_mxpol.generate_radar_table(radarname, filename=None)
     Generates a table with basic radar info, based on the given (or default) configfile Parameters ———— radarname:
     str
           name of the radar (i.e. 'ALB' or 'A', 'MXPOL' etc)
     filename: str path and name of the configfile, if None, the default configfile is used
     radar_table: dict table containing basic radar info
pyrad.io.read_data_mxpol.get_elevation_metadata(radarname, filename=None)
     Gets the elevation angles for each sweep from the configuration file Inputs —— radarname: str
           name of the radar for which to retrieve elevation angles
     filename: str name of the configuration file, if None, the default configuration file is used
     DEFAULT RADAR INFO['elevations'][radarname]: list list of elevation angles in degrees
     or None if not available
pyrad.io.read_data_mxpol.get_mymetadata(p, filename=None)
     Return a dictionary of metadata for a given parameter, p. An empty dictionary will be returned if no metadata
     dictionary exists for parameter p. Parameters –
           parameter name (i.e. Polvar) for which to return metadata
     filename: str Filename of the configuration file. If None the default configuration file is loaded from the direc-
           tory.
      _DEFAULT_METADATA[p].copy(): dict a copy of the parameter of interest from the metadata dictionary
pyrad.io.read_data_mxpol.int2float_radar(data, varname, index_angle)
     Converts radar moments from bit to float Inputs —— data: np.array
           moment data as loaded from h5 file
     varname: str name of the moment (i.e. 'ZH')
     index_angle: int rank of the sweep-1 (converted to base 0)
     output: np.array moment data converted to float
pyrad.io.read_data_mxpol.load_myconfig(filename=None)
     Load configuration from a config file. Parameters —————————————————filename: str
           Filename of the configuration file. If None the default configuration file is loaded from the directory.
     DEFAULT METADATA: dict Dictionary with metadata
```

Methods

add_field(field_name, dic[, replace_existing])	Add a field to the object.	
add_field_like(existing_field_name,[,	Add a field to the object. Add a field to the object with metadata from a exist-	
])	ing field.	
check_field_exists(field_name)	Check that a field exists in the fields dictionary.	
extract_sweeps(sweeps)	Create a new radar contains only the data from select	
exerace_sweeps(sweeps)	sweeps.	
<pre>get_azimuth(sweep[, copy])</pre>	Return an array of azimuth angles for a given sweep.	
get_elevation(sweep[, copy])	Return an array of elevation angles for a given sweep.	
get_end(sweep)	Return the ending ray for a given sweep.	
get_field(sweep, field_name[, copy])	Return the field data for a given sweep.	
get_gate_x_y_z(sweep[, edges,])	Return the x, y and z gate locations in meters for a	
yet_yate_x_y_z(sweep[, euges,])	given sweep.	
<pre>get_nyquist_vel(sweep[, check_uniform])</pre>	Return the Nyquist velocity in meters per second for	
get_nyquist_vei(sweep[, check_uniform])		
not old se(sween)	a given sweep.	
get_slice(sweep)	Return a slice for selecting rays for a given sweep.	
<pre>get_start(sweep)</pre>	Return the starting ray index for a given sweep.	
get_start_end(sweep)	Return the starting and ending ray for a given sweep.	
info([level, out])	Print information on radar.	
<pre>init_gate_altitude()</pre>	Initialize the gate_altitude attribute.	
init_gate_longitude_latitude()	Initialize or reset the gate_longitude and	
	gate_latitude attributes.	
init_gate_x_y_z()	Initialize or reset the gate $\{x, y, z\}$ attributes.	
init_rays_per_sweep()	Initialize or reset the rays_per_sweep attribute.	
<pre>iter_azimuth()</pre>	Return an iterator which returns sweep azimuth data.	
iter_elevation()	Return an iterator which returns sweep elevation	
	data.	
iter_end()	Return an iterator over the sweep end indices.	
<pre>iter_field(field_name)</pre>	Return an iterator which returns sweep field data.	
iter_slice()	Return an iterator which returns sweep slice objects.	
iter_start()	Return an iterator over the sweep start indices.	
iter_start_end()	Return an iterator over the sweep start and end in-	
	dices.	

```
__class__
    alias of builtins.type

__delattr__($self, name,/)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.io.read_data_mxpol', '__init__': <func__dir__() \rightarrow list
    default dir() implementation

__eq__ ($self, value,/)
    Return self==value.
__format__()</pre>
```

```
default object formatter
__ge__($self, value, /)
     Return self>=value.
__getattribute__ ($self, name, /)
     Return getattr(self, name).
__getstate__()
     Return object's state which can be pickled.
__gt__($self, value, /)
     Return self>value.
__hash__($self,/)
     Return hash(self).
__init__ (filename, field_names=None, max_range=inf, min_range=10000)
     Initialize self. See help(type(self)) for accurate signature.
__init_subclass__()
     This method is called when a class is subclassed.
     The default implementation does nothing. It may be overridden to extend subclasses.
___le__ ($self, value, /)
     Return self<=value.
1t ($self, value, /)
     Return self<value.
__module__ = 'pyrad.io.read_data_mxpol'
__ne__ ($self, value, /)
     Return self!=value.
__new__($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
__reduce__()
     helper for pickle
__reduce_ex__()
     helper for pickle
__repr__($self,/)
     Return repr(self).
__setattr__($self, name, value, /)
     Implement setattr(self, name, value).
__setstate__(state)
     Restore unpicklable entries from pickled object.
\_\_\mathtt{sizeof}\_\_() \to \mathrm{int}
     size of object in memory, in bytes
__str__($self,/)
    Return str(self).
__subclasshook__()
```

Abstract classes can override this to customize issubclass().

This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImplemented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal algorithm (and the outcome is cached).

```
__weakref_
```

list of weak references to the object (if defined)

```
_check_sweep_in_range(sweep)
```

Check that a sweep number is in range.

_dic_info (attr, level, out, dic=None, ident_level=0)

Print information on a dictionary attribute.

add_field (field_name, dic, replace_existing=False)

Add a field to the object.

Parameters

field_name [str] Name of the field to add to the dictionary of fields.

dic [dict] Dictionary contain field data and metadata.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

add_field_like (existing_field_name, field_name, data, replace_existing=False)

Add a field to the object with metadata from a existing field.

Note that the data parameter is not copied by this method. If data refers to a 'data' array from an existing field dictionary, a copy should be made within or prior to using this method. If this is not done the 'data' key in both field dictionaries will point to the same NumPy array and modification of one will change the second. To copy NumPy arrays use the copy() method. See the Examples section for how to create a copy of the 'reflectivity' field as a field named 'reflectivity_copy'.

Parameters

existing_field_name [str] Name of an existing field to take metadata from when adding the new field to the object.

field_name [str] Name of the field to add to the dictionary of fields.

data [array] Field data. A copy of this data is not made, see the note above.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

Examples

```
>>> radar.add_field_like('reflectivity', 'reflectivity_copy', ... radar.fields['reflectivity']['data'].copy())
```

check_field_exists(field_name)

Check that a field exists in the fields dictionary.

If the field does not exist raise a KeyError.

Parameters

field_name [str] Name of field to check.

extract_sweeps (sweeps)

Create a new radar contains only the data from select sweeps.

Parameters

sweeps [array_like] Sweeps (0-based) to include in new Radar object.

Returns

radar [Radar] Radar object which contains a copy of data from the selected sweeps.

get_azimuth (sweep, copy=False)

Return an array of azimuth angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the azimuths. False, the default, returns a view of the azimuths (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the azimuth angles for a given sweep.

get_elevation (sweep, copy=False)

Return an array of elevation angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the elevations. False, the default, returns a view of the elevations (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the elevation angles for a given sweep.

get_end(sweep)

Return the ending ray for a given sweep.

get_field(sweep, field_name, copy=False)

Return the field data for a given sweep.

When used with $get_gate_x_y_z$ () this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

field name [str] Name of the field from which data should be retrieved.

copy [bool, optional] True to return a copy of the data. False, the default, returns a view of the data (when possible), changing this data will change the data in the underlying Radar object.

Returns

data [array] Array containing data for the requested sweep and field.

get_gate_x_y_z (sweep, edges=False, filter_transitions=False)

Return the x, y and z gate locations in meters for a given sweep.

With the default parameter this method returns the same data as contained in the gate_x, gate_y and gate_z attributes but this method performs the gate location calculations only for the specified sweep and therefore is more efficient than accessing this data through these attribute.

When used with $get_field()$ this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve gate locations from, 0 based.

edges [bool, optional] True to return the locations of the gate edges calculated by interpolating between the range, azimuths and elevations. False (the default) will return the locations of the gate centers with no interpolation.

filter_transitions [bool, optional] True to remove rays where the antenna was in transition between sweeps. False will include these rays. No rays will be removed if the antenna_transition attribute is not available (set to None).

Returns

x, y, z [2D array] Array containing the x, y and z, distances from the radar in meters for the center (or edges) for all gates in the sweep.

get_nyquist_vel (sweep, check_uniform=True)

Return the Nyquist velocity in meters per second for a given sweep.

Raises a LookupError if the Nyquist velocity is not available, an Exception is raised if the velocities are not uniform in the sweep unless check_uniform is set to False.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

check_uniform [bool] True to check to perform a check on the Nyquist velocities that they are uniform in the sweep, False will skip this check and return the velocity of the first ray in the sweep.

Returns

nyquist_velocity [float] Array containing the Nyquist velocity in m/s for a given sweep.

get_slice(sweep)

Return a slice for selecting rays for a given sweep.

get_start(sweep)

Return the starting ray index for a given sweep.

get start end(sweep)

Return the starting and ending ray for a given sweep.

info (level='standard', out=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)
Print information on radar.

Parameters

level [{'compact', 'standard', 'full', 'c', 's', 'f'}] Level of information on radar object to print, compact is minimal information, standard more and full everything.

out [file-like] Stream to direct output to, default is to print information to standard out (the screen).

init_gate_altitude()

Initialize the gate_altitude attribute.

init_gate_longitude_latitude()

Initialize or reset the gate_longitude and gate_latitude attributes.

init_gate_x_y_z()

Initialize or reset the gate $\{x, y, z\}$ attributes.

init_rays_per_sweep()

Initialize or reset the rays_per_sweep attribute.

iter azimuth()

Return an iterator which returns sweep azimuth data.

iter elevation()

Return an iterator which returns sweep elevation data.

iter_end()

Return an iterator over the sweep end indices.

iter_field(field_name)

Return an iterator which returns sweep field data.

iter_slice()

Return an iterator which returns sweep slice objects.

iter start()

Return an iterator over the sweep start indices.

iter_start_end()

Return an iterator over the sweep start and end indices.

class pyrad.io.read_data_mxpol.pyrad_MCH (filename, field_names=None, max_range=inf)
 Bases: pyart.core.radar.Radar

Methods

add_field(field_name, dic[, replace_existing])	Add a field to the object.
add_field_like(existing_field_name,[,	Add a field to the object with metadata from a exist-
])	ing field.
<pre>check_field_exists(field_name)</pre>	Check that a field exists in the fields dictionary.
extract_sweeps(sweeps)	Create a new radar contains only the data from select
	sweeps.
<pre>get_azimuth(sweep[, copy])</pre>	Return an array of azimuth angles for a given sweep.
<pre>get_elevation(sweep[, copy])</pre>	Return an array of elevation angles for a given sweep.
get_end(sweep)	Return the ending ray for a given sweep.
<pre>get_field(sweep, field_name[, copy])</pre>	Return the field data for a given sweep.
<pre>get_gate_x_y_z(sweep[, edges,])</pre>	Return the x, y and z gate locations in meters for a
	given sweep.
<pre>get_nyquist_vel(sweep[, check_uniform])</pre>	Return the Nyquist velocity in meters per second for
	a given sweep.
get_slice(sweep)	Return a slice for selecting rays for a given sweep.
get_start(sweep)	Return the starting ray index for a given sweep.
<pre>get_start_end(sweep)</pre>	Return the starting and ending ray for a given sweep.
info([level, out])	Print information on radar.
init_gate_altitude()	Initialize the gate_altitude attribute.
init_gate_longitude_latitude()	Initialize or reset the gate_longitude and
	gate_latitude attributes.
init_gate_x_y_z()	Initialize or reset the gate_{x, y, z} attributes.
init_rays_per_sweep()	Initialize or reset the rays_per_sweep attribute.

Table 2 – continued from previous page

<pre>iter_azimuth()</pre>	Return an iterator which returns sweep azimuth data.
<pre>iter_elevation()</pre>	Return an iterator which returns sweep elevation
	data.
iter_end()	Return an iterator over the sweep end indices.
<pre>iter_field(field_name)</pre>	Return an iterator which returns sweep field data.
<pre>iter_slice()</pre>	Return an iterator which returns sweep slice objects.
iter_start()	Return an iterator over the sweep start indices.
iter_start_end()	Return an iterator over the sweep start and end in-
	dices.

```
__class_
    alias of builtins.type
__delattr__($self, name,/)
     Implement delattr(self, name).
__dict__ = mappingproxy({'__module__': 'pyrad.io.read_data_mxpol', '__init__': <func
\mathtt{dir} () \rightarrow list
    default dir() implementation
__eq_ ($self, value, /)
    Return self==value.
___format___()
    default object formatter
__ge__($self, value, /)
    Return self>=value.
__getattribute__ ($self, name, /)
    Return getattr(self, name).
__getstate__()
    Return object's state which can be pickled.
__gt__ ($self, value, /)
    Return self>value.
__hash__($self,/)
    Return hash(self).
__init__ (filename, field_names=None, max_range=inf)
    Initialize self. See help(type(self)) for accurate signature.
init subclass ()
     This method is called when a class is subclassed.
    The default implementation does nothing. It may be overridden to extend subclasses.
 __le__ ($self, value, /)
    Return self<=value.
___lt___($self, value, /)
    Return self<value.
__module__ = 'pyrad.io.read_data_mxpol'
__ne__ ($self, value, /)
    Return self!=value.
```

```
__new__ ($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
__reduce__()
     helper for pickle
 reduce ex ()
     helper for pickle
__repr__($self,/)
     Return repr(self).
  _setattr__ ($self, name, value,/)
     Implement setattr(self, name, value).
__setstate__(state)
     Restore unpicklable entries from pickled object.
\_\_\mathtt{sizeof}\_\_() \to \mathrm{int}
     size of object in memory, in bytes
 str ($self,/)
     Return str(self).
__subclasshook___()
     Abstract classes can override this to customize issubclass().
     This is invoked early on by abc.ABCMeta. subclasscheck (). It should return True, False or NotImple-
     mented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal
     algorithm (and the outcome is cached).
 _weakref_
     list of weak references to the object (if defined)
_check_sweep_in_range(sweep)
     Check that a sweep number is in range.
_dic_info (attr, level, out, dic=None, ident_level=0)
     Print information on a dictionary attribute.
add_field(field_name, dic, replace_existing=False)
     Add a field to the object.
         Parameters
              field_name [str] Name of the field to add to the dictionary of fields.
```

dic [dict] Dictionary contain field data and metadata.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

add_field_like (existing_field_name, field_name, data, replace_existing=False)

Add a field to the object with metadata from a existing field.

Note that the data parameter is not copied by this method. If data refers to a 'data' array from an existing field dictionary, a copy should be made within or prior to using this method. If this is not done the 'data' key in both field dictionaries will point to the same NumPy array and modification of one will change the second. To copy NumPy arrays use the copy() method. See the Examples section for how to create a copy of the 'reflectivity' field as a field named 'reflectivity_copy'.

Parameters

existing_field_name [str] Name of an existing field to take metadata from when adding the new field to the object.

field name [str] Name of the field to add to the dictionary of fields.

data [array] Field data. A copy of this data is not made, see the note above.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

Examples

```
>>> radar.add_field_like('reflectivity', 'reflectivity_copy', ... radar.fields['reflectivity']['data'].copy())
```

check field exists(field name)

Check that a field exists in the fields dictionary.

If the field does not exist raise a KeyError.

Parameters

field name [str] Name of field to check.

extract_sweeps (sweeps)

Create a new radar contains only the data from select sweeps.

Parameters

sweeps [array_like] Sweeps (0-based) to include in new Radar object.

Returns

radar [Radar] Radar object which contains a copy of data from the selected sweeps.

get_azimuth (sweep, copy=False)

Return an array of azimuth angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the azimuths. False, the default, returns a view of the azimuths (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the azimuth angles for a given sweep.

get_elevation (sweep, copy=False)

Return an array of elevation angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the elevations. False, the default, returns a view of the elevations (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the elevation angles for a given sweep.

get end(sweep)

Return the ending ray for a given sweep.

get_field(sweep, field_name, copy=False)

Return the field data for a given sweep.

When used with $get_gate_x_y_z$ () this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

field_name [str] Name of the field from which data should be retrieved.

copy [bool, optional] True to return a copy of the data. False, the default, returns a view of the data (when possible), changing this data will change the data in the underlying Radar object.

Returns

data [array] Array containing data for the requested sweep and field.

get_gate_x_y_z (sweep, edges=False, filter_transitions=False)

Return the x, y and z gate locations in meters for a given sweep.

With the default parameter this method returns the same data as contained in the gate_x, gate_y and gate_z attributes but this method performs the gate location calculations only for the specified sweep and therefore is more efficient than accessing this data through these attribute.

When used with $get_field()$ this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve gate locations from, 0 based.

edges [bool, optional] True to return the locations of the gate edges calculated by interpolating between the range, azimuths and elevations. False (the default) will return the locations of the gate centers with no interpolation.

filter_transitions [bool, optional] True to remove rays where the antenna was in transition between sweeps. False will include these rays. No rays will be removed if the antenna_transition attribute is not available (set to None).

Returns

x, y, z [2D array] Array containing the x, y and z, distances from the radar in meters for the center (or edges) for all gates in the sweep.

get_nyquist_vel (sweep, check_uniform=True)

Return the Nyquist velocity in meters per second for a given sweep.

Raises a LookupError if the Nyquist velocity is not available, an Exception is raised if the velocities are not uniform in the sweep unless check_uniform is set to False.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

check_uniform [bool] True to check to perform a check on the Nyquist velocities that they are uniform in the sweep, False will skip this check and return the velocity of the first ray in the sweep.

Returns

```
get_slice(sweep)
           Return a slice for selecting rays for a given sweep.
     get start(sweep)
          Return the starting ray index for a given sweep.
     get_start_end(sweep)
           Return the starting and ending ray for a given sweep.
     info (level='standard', out=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)
           Print information on radar.
               Parameters
                   level [{'compact', 'standard', 'full', 'c', 's', 'f'}] Level of information on radar object to
                     print, compact is minimal information, standard more and full everything.
                   out [file-like] Stream to direct output to, default is to print information to standard out (the
                     screen).
     init_gate_altitude()
           Initialize the gate altitude attribute.
     init_gate_longitude_latitude()
           Initialize or reset the gate_longitude and gate_latitude attributes.
     init_gate_x_y_z()
           Initialize or reset the gate\{x, y, z\} attributes.
     init_rays_per_sweep()
           Initialize or reset the rays_per_sweep attribute.
     iter_azimuth()
           Return an iterator which returns sweep azimuth data.
     iter elevation()
           Return an iterator which returns sweep elevation data.
     iter_end()
           Return an iterator over the sweep end indices.
     iter field(field name)
           Return an iterator which returns sweep field data.
     iter slice()
           Return an iterator which returns sweep slice objects.
     iter start()
           Return an iterator over the sweep start indices.
     iter_start_end()
           Return an iterator over the sweep start and end indices.
class pyrad.io.read_data_mxpol.pyrad_MXPOL (filename, field_names=None, max_range=inf,
                                                           min\_range=10000)
     Bases: pyart.core.radar.Radar
```

nyquist_velocity [float] Array containing the Nyquist velocity in m/s for a given sweep.

Methods

1.1. 6 1. 7. 1/6.11	A 11 - C -114 - 41114
add_field(field_name, dic[, replace_existing])	Add a field to the object.
add_field_like(existing_field_name,[,	Add a field to the object with metadata from a exist-
])	ing field.
<pre>check_field_exists(field_name)</pre>	Check that a field exists in the fields dictionary.
extract_sweeps(sweeps)	Create a new radar contains only the data from select
	sweeps.
<pre>get_azimuth(sweep[, copy])</pre>	Return an array of azimuth angles for a given sweep.
<pre>get_elevation(sweep[, copy])</pre>	Return an array of elevation angles for a given sweep.
get_end(sweep)	Return the ending ray for a given sweep.
<pre>get_field(sweep, field_name[, copy])</pre>	Return the field data for a given sweep.
<pre>get_gate_x_y_z(sweep[, edges,])</pre>	Return the x, y and z gate locations in meters for a
	given sweep.
<pre>get_nyquist_vel(sweep[, check_uniform])</pre>	Return the Nyquist velocity in meters per second for
	a given sweep.
get_slice(sweep)	Return a slice for selecting rays for a given sweep.
<pre>get_start(sweep)</pre>	Return the starting ray index for a given sweep.
get_start_end(sweep)	Return the starting and ending ray for a given sweep.
info([level, out])	Print information on radar.
init_gate_altitude()	Initialize the gate_altitude attribute.
<pre>init_gate_longitude_latitude()</pre>	Initialize or reset the gate_longitude and
	gate_latitude attributes.
init_gate_x_y_z()	Initialize or reset the gate $\{x, y, z\}$ attributes.
init_rays_per_sweep()	Initialize or reset the rays_per_sweep attribute.
<pre>iter_azimuth()</pre>	Return an iterator which returns sweep azimuth data.
iter_elevation()	Return an iterator which returns sweep elevation
	data.
iter_end()	Return an iterator over the sweep end indices.
<pre>iter_field(field_name)</pre>	Return an iterator which returns sweep field data.
<pre>iter_slice()</pre>	Return an iterator which returns sweep slice objects.
iter_start()	Return an iterator over the sweep start indices.
iter_start_end()	Return an iterator over the sweep start and end in-
	dices.

     Check that a sweep number is in range.
```

 $\verb"_dic_info" (attr, level, out, dic=None, ident_level=0)$

Print information on a dictionary attribute.

add_field (field_name, dic, replace_existing=False)

Add a field to the object.

Parameters

field_name [str] Name of the field to add to the dictionary of fields.

dic [dict] Dictionary contain field data and metadata.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

add_field_like (existing_field_name, field_name, data, replace_existing=False)

Add a field to the object with metadata from a existing field.

Note that the data parameter is not copied by this method. If data refers to a 'data' array from an existing field dictionary, a copy should be made within or prior to using this method. If this is not done the 'data' key in both field dictionaries will point to the same NumPy array and modification of one will change the second. To copy NumPy arrays use the copy() method. See the Examples section for how to create a copy of the 'reflectivity' field as a field named 'reflectivity_copy'.

Parameters

existing_field_name [str] Name of an existing field to take metadata from when adding the new field to the object.

field_name [str] Name of the field to add to the dictionary of fields.

data [array] Field data. A copy of this data is not made, see the note above.

replace_existing [bool] True to replace the existing field with key field_name if it exists, loosing any existing data. False will raise a ValueError when the field already exists.

Examples

```
>>> radar.add_field_like('reflectivity', 'reflectivity_copy', ... radar.fields['reflectivity']['data'].copy())
```

check field exists(field name)

Check that a field exists in the fields dictionary.

If the field does not exist raise a KeyError.

Parameters

field_name [str] Name of field to check.

extract sweeps (sweeps)

Create a new radar contains only the data from select sweeps.

Parameters

sweeps [array_like] Sweeps (0-based) to include in new Radar object.

Returns

radar [Radar] Radar object which contains a copy of data from the selected sweeps.

```
get_azimuth (sweep, copy=False)
```

Return an array of azimuth angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the azimuths. False, the default, returns a view of the azimuths (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the azimuth angles for a given sweep.

get_elevation (sweep, copy=False)

Return an array of elevation angles for a given sweep.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

copy [bool, optional] True to return a copy of the elevations. False, the default, returns a view of the elevations (when possible), changing this data will change the data in the underlying Radar object.

Returns

azimuths [array] Array containing the elevation angles for a given sweep.

get_end(sweep)

Return the ending ray for a given sweep.

get_field(sweep, field_name, copy=False)

Return the field data for a given sweep.

When used with $get_gate_x_y_z$ () this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

field_name [str] Name of the field from which data should be retrieved.

copy [bool, optional] True to return a copy of the data. False, the default, returns a view of the data (when possible), changing this data will change the data in the underlying Radar object.

Returns

data [array] Array containing data for the requested sweep and field.

get gate x y z (sweep, edges=False, filter transitions=False)

Return the x, y and z gate locations in meters for a given sweep.

With the default parameter this method returns the same data as contained in the gate_x, gate_y and gate_z attributes but this method performs the gate location calculations only for the specified sweep and therefore is more efficient than accessing this data through these attribute.

When used with $get_field()$ this method can be used to obtain the data needed for plotting a radar field with the correct spatial context.

Parameters

sweep [int] Sweep number to retrieve gate locations from, 0 based.

edges [bool, optional] True to return the locations of the gate edges calculated by interpolating between the range, azimuths and elevations. False (the default) will return the locations of the gate centers with no interpolation.

filter_transitions [bool, optional] True to remove rays where the antenna was in transition between sweeps. False will include these rays. No rays will be removed if the antenna_transition attribute is not available (set to None).

Returns

x, y, z [2D array] Array containing the x, y and z, distances from the radar in meters for the center (or edges) for all gates in the sweep.

get_nyquist_vel (sweep, check_uniform=True)

Return the Nyquist velocity in meters per second for a given sweep.

Raises a LookupError if the Nyquist velocity is not available, an Exception is raised if the velocities are not uniform in the sweep unless check_uniform is set to False.

Parameters

sweep [int] Sweep number to retrieve data for, 0 based.

check_uniform [bool] True to check to perform a check on the Nyquist velocities that they are uniform in the sweep, False will skip this check and return the velocity of the first ray in the sweep.

Returns

nyquist_velocity [float] Array containing the Nyquist velocity in m/s for a given sweep.

get_slice(sweep)

Return a slice for selecting rays for a given sweep.

get_start (sweep)

Return the starting ray index for a given sweep.

get_start_end(sweep)

Return the starting and ending ray for a given sweep.

info (level='standard', out=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>)
Print information on radar.

Parameters

level [{'compact', 'standard', 'full', 'c', 's', 'f'}] Level of information on radar object to print, compact is minimal information, standard more and full everything.

out [file-like] Stream to direct output to, default is to print information to standard out (the screen).

init_gate_altitude()

Initialize the gate_altitude attribute.

init_gate_longitude_latitude()

Initialize or reset the gate_longitude and gate_latitude attributes.

init_gate_x_y_z()

Initialize or reset the gate $\{x, y, z\}$ attributes.

init_rays_per_sweep()

Initialize or reset the rays_per_sweep attribute.

iter azimuth()

Return an iterator which returns sweep azimuth data.

```
iter elevation()
           Return an iterator which returns sweep elevation data.
     iter end()
           Return an iterator over the sweep end indices.
     iter field(field name)
           Return an iterator which returns sweep field data.
           Return an iterator which returns sweep slice objects.
     iter_start()
           Return an iterator over the sweep start indices.
     iter_start_end()
           Return an iterator over the sweep start and end indices.
pyrad.io.read_data_mxpol.readCHRadData(filename,
                                                                    radar_name,
                                                                                     variableList,
                                                                                                      ra-
                                                       dial_resolution, max_range=inf, min_range=0)
     Reads a HDF5 file containing processed radar data in polar coordinates Parameters -
           complete path of the file
     radar name: str name of MCH radar
     variableList: list list of variables to be read
     radial_resolution: float resolution of the radar in metres (i.e. high: 83.3, low: 500.)
     max range: float maximum range upto which to read data
     min range: float mimimum range from which to read data
     varPol: dict the projected variables, the azimuth and the range
pyrad.io.read_data_mxpol.readIDLRadData(filename,
                                                                       variableList,
                                                                                         max\_range=inf,
                                                        min\_range=0)
     Reads a netcdf containing IDL processed radar data in polar coordinates Parameters —
                                                                                          ----- filename: str
           complete path of the file

     metadata: dict dictionary containing the metadata of the file
pyrad.io.read_data_mxpol.readMXPOLRadData (filename,
                                                                         variableList.
                                                                                         max range=inf,
                                                           min\ range=0)
     Reads a netcdf containing processed radar data in polar coordinates Parameters —
           complete path of the file
     variableList: list list of variables to be read
     varPol: dict dictionary containing the variables, the azimuth and the range
     metadata: dict dictionary containing the metadata of the file
```

```
pyrad.io.read_data_mxpol.row_stack(a1, a2)
```

Stacks data from subsequent sweeps, while padding "empty" columns from subsequent sweeps. Inputs —— a1: np.array

destination array

a2: np.array array which is added onto the first array

out: np.array stacked destination and additional array, with uniform shape

Created on Wed Dec 7 10:48:31 2016

@author: fvanden

Configuration file for mxpol pyart.core.Radar class. Some information may be redundant because this file is a copy from the ProfileLab toolkit.

Functions to retrieve data from this file may be found in pyrad.io.read_data_mxpol under the utilities section

TWENTYSIX

PYRAD.IO.READ_DATA_COSMO

Functions for reading COSMO data

cosmo2radar_data(radar, cosmo_coord,	get the COSMO value corresponding to each radar gate
cosmo_data)	using nearest neighbour interpolation
cosmo2radar_coord(radar, cosmo_coord[,])	Given the radar coordinates find the nearest COSMO
	model pixel
<pre>get_cosmo_fields(cosmo_data, cosmo_ind[,])</pre>	Get the COSMO data corresponding to each radar gate
	using a precomputed look up table of the nearest neigh-
	bour
<pre>read_cosmo_data(fname[, field_names, celsius])</pre>	Reads COSMO data from a netcdf file
read_cosmo_coord(fname[, zmin])	Reads COSMO coordinates from a netcdf file
_ncvar_to_dict(ncvar[, dtype])	Convert a NetCDF Dataset variable to a dictionary.
_prepare_for_interpolation(x_radar,	prepares the COSMO 3D volume for interpolation:
y_radar,)	
_put_radar_in_swiss_coord(radar)	puts the Cartesian grid of the radar coordinates in Swiss coordinates

pyrad.io.read_data_cosmo._ncvar_to_dict(ncvar, dtype='float64')

Convert a NetCDF Dataset variable to a dictionary.

prepares the COSMO 3D volume for interpolation:

1. if set slices the cosmo data to the area (or volume)

covered by the radar

2. creates the x, y, z grid for the interpolation

Parameters

x_radar, y_radar, z_radar [arrays] The Swiss coordinates of the radar

cosmo_coord [dict] dictionary containing the COSMO coordinates

slice_xy [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

slice_z [boolean] if true the vertical plane of the COSMO field is cut to the dimensions of the
radar field

Returns

x_cosmo, y_cosmo, z_cosmo [1D arrays] arrays containing the flatten swiss coordinates of the COSMO data in the area of interest

ind_xmin, ind_ymin, ind_zmin, ind_xmax, ind_ymax, ind_zmax [ints] the minimum and maximum indices of each dimension

```
pyrad.io.read_data_cosmo._put_radar_in_swiss_coord(radar)
```

puts the Cartesian grid of the radar coordinates in Swiss coordinates

Parameters

radar [Radar] the radar object containing the information on the position of the radar gates

Returns

x_radar, y_radar, z_radar [2D arrays] arrays containing swiss coordinates of the radar [in m]

Given the radar coordinates find the nearest COSMO model pixel

Parameters

radar [Radar] the radar object containing the information on the position of the radar gates

cosmo_coord [dict] dictionary containing the COSMO coordinates

slice_xy [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

slice_z [boolean] if true the vertical plane of the COSMO field is cut to the dimensions of the radar field

field_name [str] name of the field

Returns

cosmo_ind_field [dict] dictionary containing a field of COSMO indices and metadata

get the COSMO value corresponding to each radar gate using nearest neighbour interpolation

Parameters

radar [Radar] the radar object containing the information on the position of the radar gates

cosmo_coord [dict] dictionary containing the COSMO coordinates

cosmo_data [dict] dictionary containing the COSMO data

time_index [int] index of the forecasted data

slice_xy [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

slice_z [boolean] if true the vertical plane of the COSMO field is cut to the dimensions of the radar field

field_names [str] names of COSMO fields to convert (default temperature)

Returns

cosmo_fields [list of dict] list of dictionary with the COSMO fields and metadata

```
pyrad.io.read_data_cosmo.get_cosmo_fields(cosmo_data,
                                                                         cosmo ind,
                                                                                       time index=0,
                                                         field_names=['temperature'])
     Get the COSMO data corresponding to each radar gate using a precomputed look up table of the nearest neigh-
     bour
          Parameters
              cosmo_data [dict] dictionary containing the COSMO data and metadata
              cosmo ind [dict] dictionary containing a field of COSMO indices and metadata
              time index [int] index of the forecasted data
              field_names [str] names of COSMO parameters (default temperature)
          Returns
              cosmo_fields [list of dict] dictionary with the COSMO fields and metadata
pyrad.io.read_data_cosmo.read_cosmo_coord(fname, zmin=None)
     Reads COSMO coordinates from a netcdf file
          Parameters
              fname [str] name of the file to read
          Returns
              cosmo_coord [dictionary] dictionary with the data and metadata
pyrad.io.read_data_cosmo.read_cosmo_data(fname,
                                                                 field_names=['temperature'],
                                                                                                 cel-
                                                       sius=True)
     Reads COSMO data from a netcdf file
          Parameters
              fname [str] name of the file to read
              field_names [str] name of the variable to read
              celsius [Boolean] if True and variable temperature converts data from Kelvin to Centigrade
          Returns
```

cosmo data [dictionary] dictionary with the data and metadata

pyrad library reference for developers, Release 0.0.1

CHAPTER

TWENTYSEVEN

PYRAD.IO.READ DATA HZT

Functions for reading HZT data

hzt2radar_data(radar, hzt_coord, hzt_data[,])	get the HZT value corresponding to each radar gate us-
	ing nearest neighbour interpolation
hzt2radar_coord(radar, hzt_coord[,])	Given the radar coordinates find the nearest HZT pixel
<pre>get_iso0_field(hzt_data, hzt_ind, z_radar[,])</pre>	Get the height over iso0 data corresponding to each
	radar gate using a precomputed look up table of the
	nearest neighbour
read_hzt_data(fname[, chy0, chx0])	Reads iso-0 degree data from an HZT file
_prepare_for_interpolation(x_radar,	prepares the HZT 2D volume for interpolation:
y_radar,)	

prepares the HZT 2D volume for interpolation:

- 1. if set slices the cosmo data to the area covered by the radar
- 2. creates the x, y grid for the interpolation

Parameters

x_radar, y_radar [arrays] The Swiss coordinates of the radar

hzt_coord [dict] dictionary containing the HZT coordinates

slice_xy [boolean] if true the horizontal plane of the HZT field is cut to the dimensions of the radar field

Returns

x_hzt, y_hzt [1D arrays] arrays containing the flatten swiss coordinates of the HZT data in the area of interest [m]

ind_xmin, ind_ymin, ind_xmax, ind_ymax [ints] the minimum and maximum indices of each
dimension

pyrad.io.read_data_hzt.get_iso0_field(hzt_data, hzt_ind, z_radar, field_name='height_over_iso0')

Get the height over iso0 data corresponding to each radar gate using a precomputed look up table of the nearest neighbour

Parameters

hzt_data [dict] dictionary containing the HZT data and metadata

```
hzt_ind [dict] dictionary containing a field of HZT indices and metadata
```

z_radar [ndarray] gates altitude [m MSL]

field_name [str] names of HZT parameters (default height_over_iso0)

Returns

iso0 field [list of dict] dictionary with the height over iso0 field and metadata

Given the radar coordinates find the nearest HZT pixel

Parameters

radar [Radar] the radar object containing the information on the position of the radar gates

hzt_coord [dict] dictionary containing the HZT coordinates

slice_xy [boolean] if true the horizontal plane of the HZT field is cut to the dimensions of the
radar field

field_name [str] name of the field

Returns

hzt ind field [dict] dictionary containing a field of HZT indices and metadata

```
pyrad.io.read_data_hzt.hzt2radar_data (radar, hzt_coord, hzt_data, slice_xy=True, field_name='height_over_iso0')
get the HZT value corresponding to each radar gate using nearest neighbour interpolation
```

Parameters

radar [Radar] the radar object containing the information on the position of the radar gates

hzt_coord [dict] dictionary containing the HZT coordinates

hzt_data [dict] dictionary containing the HZT data

slice_xy [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

field_name [str] name of HZT fields to convert (default height_over_iso0)

Returns

hzt_fields [list of dict] list of dictionary with the HZT fields and metadata

```
pyrad.io.read_data_hzt.read_hzt_data (fname, chy0=255.0, chx0=-160.0)
Reads iso-0 degree data from an HZT file
```

Parameters

fname [str] name of the file to read

chy0, chx0: south west point of grid in Swiss coordinates [km]

Returns

hzt_data [dictionary] dictionary with the data and metadata

TWENTYEIGHT

PYRAD.IO.READ_DATA_SENSOR

Functions for reading data from other sensors

read_trt_scores(fname)	Reads the TRT scores contained in a text file.
read_trt_cell_lightning(fname)	Reads the lightning data of a TRT cell.
read_trt_data(fname)	Reads the TRT data contained in a text file.
read_trt_traj_data(fname)	Reads the TRT cell data contained in a text file.
read_lightning(fname[, filter_data])	Reads lightning data contained in a text file.
read_meteorage(fname)	Reads METEORAGE lightning data contained in a text
	file.
read_lightning_traj(fname)	Reads lightning trajectory data contained in a csv file.
read_lightning_all(fname[, labels])	Reads a file containing lightning data and co-located po-
	larimetric data.
get_sensor_data(date, datatype, cfg)	Gets data from a point measurement sensor (rain gauge
	or disdrometer)
read_smn(fname)	Reads SwissMetNet data contained in a csv file
read_smn2(fname)	Reads SwissMetNet data contained in a csv file with for-
	mat station,time,value
read_disdro_scattering(fname)	Reads scattering parameters computed from disdrome-
	ter data contained in a text file
read_disdro(fname)	Reads scattering parameters computed from disdrome-
	ter data contained in a text file
	-

pyrad.io.read_data_sensor.get_sensor_data (date, datatype, cfg)

Gets data from a point measurement sensor (rain gauge or disdrometer)

Parameters

date [datetime object] measurement date

datatype [str] name of the data type to read

cfg [dictionary] dictionary containing sensor information

Returns

sensordate, **sensorvalue**, **label**, **period** [tupple] date, value, type of sensor and measurement period

pyrad.io.read_data_sensor.read_disdro(fname)

Reads scattering parameters computed from disdrometer data contained in a text file

Parameters

fname [str] path of time series file

Returns

date, preciptype, variable, scattering temperature: tuple The read values

```
pyrad.io.read_data_sensor.read_disdro_scattering(fname)
```

Reads scattering parameters computed from disdrometer data contained in a text file

Parameters

fname [str] path of time series file

Returns

```
date, preciptype, lwc, rr, zh, zv, zdr, ldr, ah, av, adiff, kdp, deltaco,
```

rhohv [tupple] The read values

```
pyrad.io.read_data_sensor.read_lightning(fname, filter_data=True)
```

Reads lightning data contained in a text file. The file has the following fields:

flashnr: (0 is for noise) UTC seconds of the day Time within flash (in seconds) Latitude (decimal degrees) Longitude (decimal degrees) Altitude (m MSL) Power (dBm)

Parameters

```
fname [str] path of time series file
```

filter_data [Boolean] if True filter noise (flashnr = 0)

Returns

flashnr, time_data, time_in_flash, lat, lon, alt, dBm [tupple] A tupple containing the read values. None otherwise

Reads a file containing lightning data and co-located polarimetric data. fields:

flashnr time data Time within flash (in seconds) Latitude (decimal degrees) Longitude (decimal degrees) Altitude (m MSL) Power (dBm) Polarimetric values at flash position

Parameters

fname [str] path of time series file

labels [list of str] The polarimetric variables labels

Returns

```
flashnr, time_data, time_in_flash, lat, lon, alt, dBm,
```

pol_vals_dict [tupple] A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_lightning_traj(fname)
```

Reads lightning trajectory data contained in a csv file. The file has the following fields:

Date UTC [seconds since midnight] # Flash Flash Power (dBm) Value at flash Mean value in a 3x3x3 polar box Min value in a 3x3x3 polar box Max value in a 3x3x3 polar box # valid values in the polar box

Parameters

fname [str] path of time series file

Returns

time_flash, flashnr, dBm, val_at_flash, val_mean, val_min, val_max,

nval [tupple] A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_meteorage(fname)
```

Reads METEORAGE lightning data contained in a text file. The file has the following fields:

date: date + time + time zone lon: longitude [degree] lat: latitude [degree] intens: amplitude [kilo amperes] ns: number of strokes of the flash mode: kind of localization [0,15] intra: 1 = intra-cloud, 0 = cloud-to-ground ax: length of the semi-major axis of the ellipse [km] ki2: standard deviation on the localization computation (Ki^2) ecc: eccentricity (major-axis / minor-axis) incl: ellipse inclination (angle with respect to the North, $+90^{\circ}$ is

East) [degrees]

sind: stroke index within the flash

Parameters

fname [str] path of time series file

Returns

stroke_time, lon, lat, intens, ns, mode, intra, ax, ki2, ecc, incl,

sind [tupple] A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_smn (fname)
```

Reads SwissMetNet data contained in a csv file

Parameters

fname [str] path of time series file

Returns

smn_id, date, pressure, temp, rh, precip, wspeed, wdir [tupple] The read values

```
pyrad.io.read_data_sensor.read_smn2 (fname)
```

Reads SwissMetNet data contained in a csv file with format station,time,value

Parameters

fname [str] path of time series file

Returns

smn id, date, value [tupple] The read values

```
pyrad.io.read_data_sensor.read_trt_cell_lightning(fname)
```

Reads the lightning data of a TRT cell. The file has the following fields:

traj_ID yyyymmddHHMM lon lat area RANKr nflashes flash_dens

Parameters

fname [str] path of the TRT data file

Returns

A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_trt_data(fname)
```

Reads the TRT data contained in a text file. The file has the following fields:

traj_ID yyyymmddHHMM

Description of ellipsis: lon [deg] lat [deg] ell_L [km] long ell_S [km] short ell_or [deg] orientation area [km2]

Cell speed: vel_x [km/h] vel_y [km/h] det [dBZ]: detection threshold RANKr from 0 to 40 (int)

Lightning information: CG- number (int) CG+ number (int) CG number (int) %CG+ [%]

Echo top information: ET45 [km] echotop 45 max ET45m [km] echotop 45 median ET15 [km] echotop 15 max ET15m [km] echotop 15 median

VIL and max echo: VIL [kg/m2] vertical integrated liquid content maxH [km] height of maximum reflectivity (maximum on the cell) maxHm [km] height of maximum reflectivity (median per cell)

POH [%] RANK (deprecated)

standard deviation of the current time step cell velocity respect to the previous time: Dvel_x [km/h] Dvel_y [km/h]

cell_contour_lon-lat

Parameters

fname [str] path of the TRT data file

Returns

A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_trt_scores(fname)
```

Reads the TRT scores contained in a text file. The file has the following fields:

traj ID max flash density time max flash density rank max flash density max rank time max rank

Parameters

fname [str] path of the TRT data file

Returns

A tupple containing the read values. None otherwise

```
pyrad.io.read_data_sensor.read_trt_traj_data(fname)
```

Reads the TRT cell data contained in a text file. The file has the following fields:

traj ID yyyymmddHHMM

lon [deg] lat [deg] ell_L [km] long ell_S [km] short ell_or [deg] orientation area [km2]

vel_x [km/h] cell speed vel_y [km/h] det [dBZ] detection threshold RANKr from 0 to 40 (int)

CG- number (int) CG+ number (int) CG number (int) %CG+ [%]

ET45 [km] echotop 45 max ET45m [km] echotop 45 median ET15 [km] echotop 15 max ET15m [km] echotop 15 median VIL [kg/m2] vertical integrated liquid content maxH [km] height of maximum reflectivity (maximum on the cell) maxHm [km] height of maximum reflectivity (median per cell) POH [%] RANK (deprecated)

Standard deviation of the current time step cell velocity respect to the previous time: Dvel_x [km/h] Dvel_y [km/h]

cell_contour_lon-lat

Parameters

fname [str] path of the TRT data file

Returns

A tupple containing the read values. None otherwise

yrad library reference for developers, Release 0.0.1	

TWENTYNINE

PYRAD.IO.READ DATA SUN

Functions for reading data used in sun monitoring

read_sun_hits_multiple_days(cfg,	Reads sun hits data from multiple file sources
$time_ref[, \dots])$	
read_sun_hits(fname)	Reads sun hits data contained in a csv file
read_sun_retrieval(fname)	Reads sun retrieval data contained in a csv file
read_solar_flux(fname)	Reads solar flux data from the DRAO observatory in
	Canada

 $\verb"pyrad.io.read_data_sun.read_solar_flux" (\textit{fname})$

Reads solar flux data from the DRAO observatory in Canada

Parameters

fname [str] path of time series file

Returns

flux_datetime [datetime array] the date and time of the solar flux retrievals

flux_value [array] the observed solar flux

pyrad.io.read_data_sun.read_sun_hits(fname)

Reads sun hits data contained in a csv file

Parameters

fname [str] path of time series file

Returns

date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,

pv, **pv_std**, **npv**, **nvalv**, **zdr**, **zdr_std**, **nzdr**, **nvalzdr** [tupple] Each parameter is an array containing a time series of information on a variable

pyrad.io.read_data_sun.read_sun_hits_multiple_days (cfg, time_ref, nfiles=1)
 Reads sun hits data from multiple file sources

Parameters

cfg [dict] dictionary with configuration data to find out the right file

time_ref [datetime object] reference time

nfiles [int] number of files to read

Returns

date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,

pv, **pv_std**, **npv**, **nvalv**, **zdr**, **zdr_std**, **nzdr**, **nvalzdr** [tupple] Each parameter is an array containing a time series of information on a variable

pyrad.io.read_data_sun.read_sun_retrieval(fname)

Reads sun retrieval data contained in a csv file

Parameters

fname [str] path of time series file

Returns

```
first_hit_time, last_hit_time, nhits_h, el_width_h, az_width_h, el_bias_h, az_bias_h, dBm_sun_est, std_dBm_sun_est, sf_h, nhits_v, el_width_v, az_width_v, el_bias_v, az_bias_v, dBmv_sun_est, std_dBmv_sun_est, sf_v, nhits_zdr, zdr_sun_est, std_zdr_sun_est,
```

sf_ref, ref_time [tupple] Each parameter is an array containing a time series of information on a variable

THIRTY

PYRAD.IO.READ_DATA_OTHER

Functions for reading auxiliary data

read_profile_ts(fname_list, labels[, hres,])	Reads a colection of profile data file and creates a time
	series
<pre>read_histogram_ts(fname_list, datatype[, t_res])</pre>	Reads a colection of histogram data file and creates a
	time series
<pre>read_quantiles_ts(fname_list[, step, qmin,])</pre>	Reads a colection of quantiles data file and creates a
	time series
read_rhi_profile(fname[, labels])	Reads a monitoring time series contained in a csv file
read_last_state(fname)	Reads a file containing the date of acquisition of the last
	volume processed
read_status(voltime, cfg[, ind_rad])	Reads rad4alp xml status file.
read_rad4alp_cosmo(fname, datatype[, ngates])	Reads rad4alp COSMO data binary file.
read_rad4alp_vis(fname, datatype)	Reads rad4alp visibility data binary file.
read_histogram(fname)	Reads a histogram contained in a csv file
read_quantiles(fname)	Reads quantiles contained in a csv file
read_excess_gates(fname)	Reads a csv files containing the position of gates ex-
	ceeding a given percentile of frequency of occurrence
read_colocated_gates(fname)	Reads a csv files containing the position of colocated
	gates
read_colocated_data(fname)	Reads a csv files containing colocated data
read_colocated_data_time_avg(fname)	Reads a csv files containing time averaged colocated
	data
read_timeseries(fname)	Reads a time series contained in a csv file
read_ts_cum(fname)	Reads a time series of precipitation accumulation con-
	tained in a csv file
read_ml_ts(fname)	Danda a maltina laccationa accide contained in a contained
	Reads a melting layer time series contained in a csv file
<pre>read_monitoring_ts(fname[, sort_by_date])</pre>	Reads a monitoring time series contained in a csv file
<pre>read_monitoring_ts(fname[, sort_by_date]) read_monitoring_ts_old(fname)</pre>	
read_monitoring_ts_old(fname)	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[,</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series con-
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[, sort_by_date])</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[,</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[,</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file Reads a radar intercomparison scores csv file in old format
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[, sort_by_date])</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file Reads a radar intercomparison scores csv file in old format Reads a radar intercomparison scores csv file in the old-
read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[, sort_by_date]) read_intercomp_scores_ts_old(fname) read_intercomp_scores_ts_old_v0(fname[,])	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file Reads a radar intercomparison scores csv file in old format Reads a radar intercomparison scores csv file in the oldest format
<pre>read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[,</pre>	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file Reads a radar intercomparison scores csv file in old format Reads a radar intercomparison scores csv file in the old-
read_monitoring_ts_old(fname) read_intercomp_scores_ts(fname[, sort_by_date]) read_intercomp_scores_ts_old(fname) read_intercomp_scores_ts_old_v0(fname[,])	Reads a monitoring time series contained in a csv file Reads an old format of the monitoring time series contained in a text file Reads a radar intercomparison scores csv file Reads a radar intercomparison scores csv file in old format Reads a radar intercomparison scores csv file in the oldest format

```
pyrad.io.read_data_other.read_antenna_pattern(fname, linear=False, twoway=False)
     Read antenna pattern from file
          Parameters
              fname [str] path of the antenna pattern file
              linear [boolean] if true the antenna pattern is given in linear units
              twoway [boolean] if true the attenuation is two-way
          Returns
              pattern [dict] dictionary with the fields angle and attenuation
pyrad.io.read_data_other.read_colocated_data(fname)
     Reads a csv files containing colocated data
          Parameters
              fname [str] path of time series file
          Returns
              rad1_time, rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,
              rad1_val, rad2_time, rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_azi,
              rad2_rng, rad2_val [tupple] A tupple with the data read. None otherwise
pyrad.io.read data other.read colocated data time avg(fname)
     Reads a csv files containing time averaged colocated data
          Parameters
              fname [str] path of time series file
          Returns
              rad1_time, rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,
              rad1_val, rad2_time, rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_azi,
              rad2_rng, rad2_val [tupple] A tupple with the data read. None otherwise
pyrad.io.read data other.read colocated gates (fname)
     Reads a csv files containing the position of colocated gates
          Parameters
              fname [str] path of time series file
          Returns
              rad1 ray ind, rad1 rng ind, rad1 ele, rad1 azi, rad1 rng,
              rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_rag [tupple] A tupple with the data
                  read. None otherwise
pyrad.io.read_data_other.read_excess_gates(fname)
     Reads a csv files containing the position of gates exceeding a given percentile of frequency of occurrence
          Parameters
              fname [str] path of time series file
          Returns
              rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,
```

```
rad2 ray ind, rad2 rng ind, rad2 ele, rad2 azi, rad2 rng [tupple] A tupple with the data
                  read. None otherwise
pyrad.io.read_data_other.read_histogram(fname)
     Reads a histogram contained in a csv file
          Parameters
              fname [str] path of time series file
          Returns
              hist, bin_edges [tupple] The read data. None otherwise
pyrad.io.read_data_other.read_histogram_ts (fname_list, datatype, t_res=300.0)
     Reads a colection of histogram data file and creates a time series
          Parameters
              fname_list [str] list of files to read
              datatype [str] The data type (dBZ, ZDR, etc.)
              t res [float] time resolution [s]. If None the time resolution is taken as the median
          Returns
              tbin_edges, bin_edges, data_ma, datetime_arr[0] [tupple] The read data. None otherwise
pyrad.io.read data other.read intercomp scores ts(fname, sort by date=False)
     Reads a radar intercomparison scores csv file
          Parameters
              fname [str] path of time series file
              sort_by_date [bool] if True, the read data is sorted by date prior to exit
          Returns
              date_vec, np_vec, meanbias_vec, medianbias_vec, quant25bias_vec,
              quant75bias_vec, modebias_vec, corr_vec, slope_vec, intercep_vec,
              intercep_slope1_vec [tupple] The read data. None otherwise
pyrad.io.read_data_other.read_intercomp_scores_ts_old(fname)
     Reads a radar intercomparison scores csv file in old format
          Parameters
              fname [str] path of time series file
          Returns
              date_vec, np_vec, meanbias_vec, medianbias_vec, quant25bias_vec,
              quant75bias_vec, modebias_vec, corr_vec, slope_vec, intercep_vec,
              intercep_slope1_vec [tupple] The read data. None otherwise
pyrad.io.read_data_other.read_intercomp_scores_ts_old_v0 (fname,
                                                                                       corr_min=0.6,
                                                                             np_min=9)
     Reads a radar intercomparison scores csv file in the oldest format
          Parameters
              fname [str] path of time series file
          Returns
```

```
date_vec, np_vec, meanbias_vec, medianbias_vec, quant25bias_vec,
               quant75bias_vec, modebias_vec, corr_vec, slope_vec, intercep_vec,
               intercep_slope1_vec [tupple] The read data. None otherwise
pyrad.io.read_data_other.read_last_state(fname)
     Reads a file containing the date of acquisition of the last volume processed
          Parameters
               fname [str] name of the file to read
          Returns
               last_state [datetime object] the date
pyrad.io.read_data_other.read_ml_ts(fname)
     Reads a melting layer time series contained in a csv file
          Parameters
               fname [str] path of time series file
          Returns
               dt_ml, ml_top_avg, ml_top_std, thick_avg, thick_std, nrays_valid,
               nrays_total [tupple] The read data. None otherwise
pyrad.io.read_data_other.read_monitoring_ts(fname, sort_by_date=False)
     Reads a monitoring time series contained in a csv file
          Parameters
               fname [str] path of time series file
               sort_by_date [bool] if True, the read data is sorted by date prior to exit
          Returns
               date, np_t, central_quantile, low_quantile, high_quantile [tupple] The read data. None oth-
                   erwise
pyrad.io.read_data_other.read_monitoring_ts_old(fname)
     Reads an old format of the monitoring time series contained in a text file
          Parameters
               fname [str] path of time series file
          Returns
               date, np_t, central_quantile, low_quantile, high_quantile [tupple] The read data in the cur-
                   rent format. None otherwise
pyrad.io.read_data_other.read_profile_ts(fname_list, labels, hres=None, label_nr=0,
                                                        t_res=300.0
     Reads a colection of profile data file and creates a time series
          Parameters
               fname_list [str] list of files to read
               labels [list of str] The data labels
               hres [float] Height resolution
               label nr [int] the label nr of the data that will be used in the time series
```

t_res [float] time resolution [s]. If None the time resolution is taken as the median

Returns

tbin_edges, **hbin_edges**, **np_ma**, **data_ma**, **datetime_arr[0]** [tupple] The read data. None otherwise

pyrad.io.read data other.read quantiles(fname)

Reads quantiles contained in a csv file

Parameters

fname [str] path of time series file

Returns

quantiles, values [tupple] The read data. None otherwise

pyrad.io.read_data_other.read_quantiles_ts (fname_list, step=5.0, qmin=0.0, qmax=100.0, t res=300.0)

Reads a colection of quantiles data file and creates a time series

Parameters

fname_list [str] list of files to read

step, qmin, qmax [float] The minimum, maximum and step quantiles

t_res [float] time resolution [s]. If None the time resolution is taken as the median

Returns

tbin_edges, qbin_edges, data_ma, datetime_arr[0] [tupple] The read data. None otherwise

pyrad.io.read_data_other.read_rad4alp_cosmo (fname, datatype, ngates=0)
Reads rad4alp COSMO data binary file.

Parameters

fname [str] name of the file to read

datatype [str] name of the data type

ngates [int] maximum number of range gates per ray. If larger than 0 the radar field will be cut accordingly.

Returns

field [dictionary] The data field

pyrad.io.read_data_other.read_rad4alp_vis(fname, datatype)

Reads rad4alp visibility data binary file.

Parameters

fname [str] name of the file to read

datatype [str] name of the data type

Returns

field_list [list of dictionaries] A data field. Each element of the list corresponds to one elevation

pyrad.io.read_data_other.read_rhi_profile (fname, labels=['50.0-percentile', '25.0-percentile', '75.0-percentile'])

Reads a monitoring time series contained in a csv file

Parameters

```
fname [str] path of time series file labels [list of str] The data labels
```

Returns

height, np_t, vals [tupple] The read data. None otherwise

```
pyrad.io.read_data_other.read_selfconsistency (fname)
```

Reads a self-consistency table with Zdr, Kdp/Zh columns

Parameters

fname [str] path of time series file

Returns

zdr, kdpzh [arrays] The read values

```
pyrad.io.read_data_other.read_status (voltime, cfg, ind_rad=0)
Reads rad4alp xml status file.
```

Parameters

voltime [datetime object] volume scan time

cfg: dictionary of dictionaries configuration info to figure out where the data is

ind_rad: int radar index

Returns

root [root element object] The information contained in the status file

```
pyrad.io.read_data_other.read_timeseries(fname)
```

Reads a time series contained in a csv file

Parameters

fname [str] path of time series file

Returns

date, value [tupple] A datetime object array containing the time and a numpy masked array containing the value. None otherwise

```
pyrad.io.read_data_other.read_ts_cum (fname)
```

Reads a time series of precipitation accumulation contained in a csv file

Parameters

fname [str] path of time series file

Returns

date, np_radar, radar_value, np_sensor, sensor_value [tupple] The data read

THIRTYONE

PYRAD.IO.WRITE_DATA

Functions for writing pyrad output data

write_ts_lightning(flashnr, time_data,)	writes the LMA sources data and the value of the colo-
	cated polarimetric variables
send_msg(sender, receiver_list, subject, fname)	sends the content of a text file by email
write_alarm_msg(radar_name, param_name_unit,	writes an alarm file
)	
write_last_state(datetime_last, fname)	writes SwissMetNet data in format datetime,avg_value,
	std_value
write_smn(datetime_vec, value_avg_vec,)	writes SwissMetNet data in format datetime,avg_value,
	std_value
write_trt_cell_data(traj_ID, yyyymmd-	writes TRT cell data
dHHMM,)	
write_trt_cell_scores(traj_ID,)	writes TRT cells scores
write_trt_cell_lightning(cell_ID, cell_time,	writes the lightning data for each TRT cell
)	
write_rhi_profile(hvec, data, nvalid_vec,)	writes the values of an RHI profile in a text file
write_field_coverage(quantiles, values,)	writes the quantiles of the coverage on a particular sec-
	tor
write_cdf(quantiles, values, ntot, nnan,)	writes a cumulative distribution function
write_histogram(bin_edges, values, fname[,])	writes a histogram
write_quantiles(quantiles, values, fname[,])	writes quantiles
write_ts_polar_data(dataset, fname)	writes time series of data
<pre>write_ts_ml(dt_ml, ml_top_avg, ml_top_std,)</pre>	writes time series of melting layer data
<pre>write_ts_cum(dataset, fname)</pre>	writes time series accumulation of data
write_monitoring_ts(start_time, np_t,[,	writes time series of data
])	
write_excess_gates(excess_dict, fname)	Writes the position and values of gates that have a fre-
	quency of occurrence higher than a particular threshold
write_intercomp_scores_ts(start_time, stats,	writes time series of radar intercomparison scores
)	
write_colocated_gates(coloc_gates, fname)	Writes the position of gates colocated with two radars
write_colocated_data(coloc_data, fname)	Writes the data of gates colocated with two radars
write_colocated_data_time_avg(coloc_data,	Writes the time averaged data of gates colocated with
fname)	two radars
write_sun_hits(sun_hits, fname)	Writes sun hits data.
write_sun_retrieval(sun_retrieval, fname)	Writes sun retrieval data.

pyrad.io.write_data.send_msg(sender, receiver_list, subject, fname)
 sends the content of a text file by email

Parameters

sender [str] the email address of the sender

receiver_list [list of string] list with the email addresses of the receiver

subject [str] the subject of the email

fname [str] name of the file containing the content of the email message

Returns

fname [str] the name of the file containing the content

writes an alarm file

Parameters

radar_name [str] Name of the radar being controlled

param_name_unit [str] Parameter and units

date_last [datetime object] date of the current event

target, tol_abs [float] Target value and tolerance

np_trend [int] Total number of points in trend

value_trend, tol_trend [float] Trend value and tolerance

nevents: int Number of events in trend

np_last [int] Number of points in the current event

value_last [float] Value of the current event

fname [str] Name of file where to store the alarm information

Returns

fname [str] the name of the file where data has written

pyrad.io.write_data.write_cdf (quantiles, values, ntot, nnan, nclut, nblocked, nprec_filter, noutliers, ncdf, fname, use_nans=False, nan_value=0.0, filterprec=[], vismin=None, sector=None, datatype=None, timeinfo=None)

writes a cumulative distribution function

Parameters

quantiles [datetime array] array containing the measurement time

values [float array] array containing the average value

fname [float array] array containing the standard deviation

sector [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

pyrad.io.write_data.write_colocated_data(coloc_data, fname)

Writes the data of gates colocated with two radars

Parameters

coloc_data [dict] dictionary containing the colocated data parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

pyrad.io.write_data.write_colocated_data_time_avg(coloc_data, fname)

Writes the time averaged data of gates colocated with two radars

Parameters

coloc_data [dict] dictionary containing the colocated data parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

pyrad.io.write_data.write_colocated_gates (coloc_gates, fname)

Writes the position of gates colocated with two radars

Parameters

coloc_gates [dict] dictionary containing the colocated gates parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

pyrad.io.write data.write excess gates (excess dict, fname)

Writes the position and values of gates that have a frequency of occurrence higher than a particular threshold

Parameters

excess_dict [dict] dictionary containing the gates parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

writes the quantiles of the coverage on a particular sector

Parameters

quantiles [datetime array] array containing the quantiles computed

values [float array] quantile value

ele_start, ele_stop, azi_start, azi_stop [float] The limits of the sector

threshold [float] The minimum value to consider the data valid

nvalid_min [int] the minimum number of points to consider that there are values in a ray

datatype [str] data type and units

timeinfo [datetime object] the time stamp of the data

fname [str] name of the file where to write the data

Returns

```
fname [str] the name of the file where data has written
pyrad.io.write_data.write_histogram(bin_edges,
                                                                values,
                                                                         fname,
                                                                                   datatype='undefined',
                                                  step=0)
     writes a histogram
           Parameters
               bin_edges [float array] array containing the histogram bin edges
               values [int array] array containing the number of points in each bin
               fname [str] file name
               datatype:str The data type
               step [str] The bin step
           Returns
               fname [str] the name of the file where data has written
pyrad.io.write_data.write_intercomp_scores_ts(start_time,
                                                                                             field_name,
                                                                                  stats,
                                                                               rad1_name='RADAR001',
                                                                 rad2 name='RADAR002',
                                                                 rewrite=False)
     writes time series of radar intercomparison scores
           Parameters
               start_time [datetime object or array of date time objects] the time of the intercomparison
               stats [dict] dictionary containing the statistics
               field_name [str] The name of the field
               fname [str] file name where to store the data
               rad1_name, rad2_name [str] Name of the radars intercompared
               rewrite [bool] if True a new file is created
           Returns
               fname [str] the name of the file where data has written
pyrad.io.write data.write last state(datetime last, fname)
     writes SwissMetNet data in format datetime,avg_value, std_value
           Parameters
               datetime last [datetime object] date and time of the last state
               fname [str] file name where to store the data
           Returns
               fname [str] the name of the file where data has written
pyrad.io.write_data.write_monitoring_ts (start_time, np_t, values, quantiles, datatype, fname,
                                                        rewrite=False)
     writes time series of data
           Parameters
               start_time [datetime object or array of date time objects] the time of the monitoring
               np_t [int or array of ints] the total number of points
               values: float array with 3 elements of array of arrays the values at certain quantiles
```

```
datatype [str] The data type
               fname [str] file name where to store the data
               rewrite [bool] if True a new file is created
           Returns
               fname [str] the name of the file where data has written
pyrad.io.write_data.write_quantiles (quantiles, values, fname, datatype='undefined')
      writes quantiles
           Parameters
               quantiles [float array] array containing the quantiles to write
               values [float array] array containing the value of each quantile
               fname [str] file name
               datatype:str The data type
           Returns
               fname [str] the name of the file where data has written
pyrad.io.write_data.write_rhi_profile (hvec, data, nvalid_vec, labels, fname, datatype=None,
                                                       timeinfo=None, sector=None)
      writes the values of an RHI profile in a text file
           Parameters
               hvec [float array] array containing the alitude in m MSL
               data [list of float array] the quantities at each altitude
               nvalid_vec [int array] number of valid data points used to compute the quantiles
               labels [list of strings] label specifying the quantitites in data
               fname [str] file name where to store the data
               datatype [str] the data type
               timeinfo [datetime object] time of the rhi profile
               sector [dict] dictionary specying the sector limits
           Returns
               fname [str] the name of the file where data has been written
pyrad.io.write_data.write_smn(datetime_vec, value_avg_vec, value_std_vec, fname)
      writes SwissMetNet data in format datetime, avg value, std value
           Parameters
               datetime_vec [datetime array] array containing the measurement time
               value_avg_vec [float array] array containing the average value
               value_std_vec [float array] array containing the standard deviation
               fname [str] file name where to store the data
           Returns
               fname [str] the name of the file where data has written
```

quantiles: float array with 3 elements the quantiles computed

```
pyrad.io.write_data.write_sun_hits(sun_hits, fname)
Writes sun hits data.
```

Parameters

sun_hits [dict] dictionary containing the sun hits parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

pyrad.io.write_data.write_sun_retrieval (sun_retrieval, fname)
Writes sun retrieval data.

Parameters

sun_retrieval [dict] dictionary containing the sun retrieval parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_trt_cell_data(traj_ID, yyyymmddHHMM, lon, lat, ell_L, ell_S, ell_or, area, vel_x, vel_y, det, RANKr, CG_n, CG_p, CG, CG_percent_p, ET45, ET45m, ET15, ET15m, VIL, maxH, maxHm, POH, RANK, Dvel_x, Dvel_y, cell_contour, fname)
```

writes TRT cell data

Parameters

traj_ID, yyyymmddHHMM, lon, lat, ell_L, ell_S, ell_or, area,

vel_x, vel_y, det, RANKr, CG_n, CG_p, CG, CG_percent_p, ET45,

ET45m, ET15, ET15m, VIL, maxH, maxHm, POH, RANK, Dvel_x,

Dvel_y, cell_contour: the cell parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_trt_cell_lightning(cell_ID, cell_time, lon, lat, area, rank, nflash, flash_density, fname)
writes the lightning data for each TRT cell
```

Parameters

cell_ID [array of ints] the cell ID

cell time [array of datetime] the time step

lon, lat [array of floats] the latitude and longitude of the center of the cell

area [array of floats] the area of the cell

rank [array of floats] the rank of the cell

nflash [array of ints] the number of flashes/sources within the cell

flash_density [array of floats] the flash/source density

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_trt_cell_scores(traj_ID, flash_density_max_time, flash_density_max_rank, nflashes_max_list, area_flash_max_list, flash_density_max, rank max time, rank max, fname)
```

writes TRT cells scores

Parameters

traj_ID [array of ints] The ID of the cells

flash_density_max_time [array of date times] The time at which the maximum flash density was reached for each cell

flash_density_max_rank [array of floats] The rank when the maximum flash density was reached for each cell

nflashes_max_list [array of ints] the number of flashes when the max flash density was reached

area_flash_max_list [array of floats] The area when the max flash density was reached

flash_density_max [array of floats] The maximum flash density for each cell

rank_max_time [array of datetime] the time at wich the maximum rank of each cell was reached

rank_max [array of float] the rank when the maximum rank of each cell was reached

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_ts_cum(dataset, fname)
    writes time series accumulation of data
```

Parameters

dataset [dict] dictionary containing the time series parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_ts_lightning (flashnr, time_data, time_in_flash, lat, lon, alt, dBm, vals_list, fname, pol_vals_labels)
writes the LMA sources data and the value of the colocated polarimetric variables
```

Parameters

flashnr [int] flash number

time_data [datetime object] flash source time

time_in_flash [float] seconds since start of flash

lat, lon, alt [float] latitude, longitude [deg] and altitude [m MSL] of the flash source

dBm [float] flash power

vals_list [list of arrays] List containing the data for each polarimetric variable

fname [str] the name of the file containing the content

pol_values_labels [list of strings] List containing strings identifying each polarimetric variable

Returns

fname [str] the name of the file containing the content

pyrad.io.write_data.write_ts_ml (dt_ml, ml_top_avg, ml_top_std, thick_avg, thick_std, nrays_valid, nrays_total, fname)
writes time series of melting layer data

Parameters

dt_ml [date time array] array of time steps

ml_top_avg, ml_top_std: float arrays the average and the standard deviation of the melting
layer top height

thick_avg, thick_std: float arrays the average and the standard deviation of the metling layer thickness

nrays_valid, nrays_total: int arrays the number of rays where melting layer has been identified and the total number of arrays in the scan

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

```
pyrad.io.write_data.write_ts_polar_data(dataset, fname)
    writes time series of data
```

Parameters

dataset [dict] dictionary containing the time series parameters

fname [str] file name where to store the data

Returns

fname [str] the name of the file where data has written

THIRTYTWO

PYRAD.IO.TIMESERIES

TimeSeries class implementation for holding timeseries data.

```
TimeSeries(desc[, timevec, timeformat, ...]) Holding timeseries data and metadata.

class pyrad.io.timeseries.TimeSeries(desc, timevec=None, timeformat=None, maxlength=None, datatype=")

Bases: object

Holding timeseries data and metadata.

Attributes

description [array of str] Description of the data of the time series.

time_vector [array of datetime objects]

timeformat [how to print the time (default:] 'Date, UTC [seconds since midnight]'

dataseries [List of _dataSeries object holding the] data
```

Methods

___format___()

default object formatter

add_dataseries(label, unit_name, unit[,])	Add a new data series to the timeseries object.
add_timesample(dt, values)	Add a new sample to the time series.
plot(fname[, ymin, ymax])	Make a figure of a time series
plot_hist(fname[, step])	Make histograms of time series
write(fname)	Write time series output

```
__class__
    alias of builtins.type

__delattr__($self, name, /)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.io.timeseries', '__doc__': "\n Holding
    __dir__() → list
    __default dir() implementation

__eq__ ($self, value, /)
    Return self==value.
```

```
__ge__($self, value, /)
     Return self>=value.
__getattribute__ ($self, name, /)
     Return getattr(self, name).
__gt__ ($self, value, /)
     Return self>value.
__hash___($self,/)
     Return hash(self).
 _init__ (desc, timevec=None, timeformat=None, maxlength=None, datatype=")
     Initalize the object.
         Parameters
             desc [array of str]
             timevec [array of datetime]
             timeformat [specifies time format]
             maxlength [Maximal length of the time series]
             num_el [Number of values in the time series]
__init_subclass__()
     This method is called when a class is subclassed.
     The default implementation does nothing. It may be overridden to extend subclasses.
__le__ ($self, value, /)
     Return self<=value.
___1t___ ($self, value, /)
     Return self<value.
__module__ = 'pyrad.io.timeseries'
___ne___($self, value,/)
     Return self!=value.
__new__($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
__reduce__()
     helper for pickle
reduce ex ()
     helper for pickle
__repr__($self,/)
     Return repr(self).
__setattr__($self, name, value, /)
     Implement setattr(self, name, value).
\_sizeof\_() \rightarrow int
     size of object in memory, in bytes
 _str__($self,/)
     Return str(self).
```

```
subclasshook___()
          Abstract classes can override this to customize issubclass().
          This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImple-
          mented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal
          algorithm (and the outcome is cached).
       weakref
          list of weak references to the object (if defined)
     add_dataseries (label, unit_name, unit, dataseries=None, plot=True, color=None, linestyle=None)
          Add a new data series to the timeseries object. The length of the data vector must be the same as the length
          of the time vector.
     add_timesample (dt, values)
          Add a new sample to the time series.
     plot (fname, ymin=None, ymax=None)
          Make a figure of a time series
     plot hist(fname, step=None)
          Make histograms of time series
     write(fname)
          Write time series output
class pyrad.io.timeseries._DataSeries (label, unit_name, unit, data, plot=True, color=None,
                                                    linestyle=None)
     Bases: object
     Hold a data vector and some meta information.
     Methods
    set_value(i, val)
                                                       Append value to array
     __class_
          alias of builtins.type
      delattr ($self, name, /)
          Implement delattr(self, name).
     __dict__ = mappingproxy({'__module__': 'pyrad.io.timeseries', '__doc__':
                                                                                                             '\n Hold a
      \mathtt{dir} () \rightarrow list
          default dir() implementation
     __eq_ ($self, value, /)
          Return self==value.
     ___format___()
          default object formatter
       _ge__($self, value,/)
          Return self>=value.
     __getattribute__ ($self, name, /)
          Return getattr(self, name).
     __gt__ ($self, value, /)
          Return self>value.
```

```
__hash__ ($self,/)
     Return hash(self).
__init__ (label, unit_name, unit, data, plot=True, color=None, linestyle=None)
     Initalize the object.
init subclass ()
     This method is called when a class is subclassed.
     The default implementation does nothing. It may be overridden to extend subclasses.
___le___($self, value, /)
     Return self<=value.
__lt__ ($self, value, /)
     Return self<value.
__module__ = 'pyrad.io.timeseries'
__ne__($self, value,/)
     Return self!=value.
__new___($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.

     size of object in memory, in bytes
__str__($self,/)
     Return str(self).
__subclasshook__()
     Abstract classes can override this to customize issubclass().
     This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImple-
     mented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal
     algorithm (and the outcome is cached).
 weakref
     list of weak references to the object (if defined)
set_value(i, val)
     Append value to array
```

THIRTYTHREE

PYRAD.IO.TRAJECTORY

Trajectory class implementation for reading trajectory file. Converting to different coordinate systems.

Trajectory(filename[, starttime, endtime,])	A class for reading and handling trajectory data from a file.
_Radar_Trajectory(lat, lon, alt)	A class for holding the trajectory data assigned to a radar.

Bases: object

A class for reading and handling trajectory data from a file.

Attributes

filename [str] Path and name of the trajectory definition file

starttime [datetime] Start time of trajectory processing.

endtime [datetime] End time of trajectory processing.

trajtype [str]

Type of trajectory. Can be 'plane' or 'lightning'

time_vector [Array of datetime objects] Array containing the trajectory time samples

wgs84_lat_deg [Array of floats] WGS84 latitude samples in radian

wgs84_lon_deg [Array of floats] WGS84 longitude samples in radian

wgs84_alt_m [Array of floats] WGS84 altitude samples in m

nsamples [int]

Number of samples in the trajectory

_swiss_grid_done [Bool] Indicates that convertion to Swiss coordinates has been performed

swiss_chy, swiss_chx, swiss_chh [Array of floats] Swiss coordinates in m

radar_list [list] List of radars for which trajectories are going to be computed

flashnr [int] For 'lightning' only. Number of flash for which trajectory data is going to be computed. If 0 all all flashes are going to be considered.

time_in_flash [array of floats] For 'lightning' only. Time within flash (sec)

flashnr_vec [array of ints] For 'lightning' only. Flash number of each data sample

dBm [array of floats] For 'lightning' only. Lightning power (dBm)

Methods

add_radar(radar)	Add the coordinates (WGS84 longitude, latitude and non WGS84 altitude) of a radar to the radar_list.
calculate_velocities(radar)	Calculate velocities.
<pre>get_end_time()</pre>	Get time of last trajectory sample.
<pre>get_samples_in_period([start, end])</pre>	"
<pre>get_start_time()</pre>	Get time of first trajectory sample.

```
__class__
     alias of builtins.type
__delattr___($self, name,/)
     Implement delattr(self, name).
__dict__ = mappingproxy({'__module__': 'pyrad.io.trajectory', '__doc__': "\n A class
\underline{\mathtt{dir}}_{\underline{\hspace{1cm}}}() \rightarrow \mathrm{list}
     default dir() implementation
__eq_ ($self, value, /)
     Return self==value.
___format___()
     default object formatter
__ge__ ($self, value, /)
     Return self>=value.
__getattribute__ ($self, name, /)
     Return getattr(self, name).
__gt__ ($self, value, /)
     Return self>value.
__hash__ ($self,/)
     Return hash(self).
__init__ (filename, starttime=None, endtime=None, trajtype='plane', flashnr=0)
     Initalize the object.
```

Parameters

filename [str] Filename containing the trajectory samples.

starttime [datetime] Start time of trajectory processing. If not given, use the time of the first trajectory sample.

endtime [datetime] End time of trajectory processing. If not given, use the time of the last trajectory sample.

trajtype [str] type of trajectory. Can be plane or lightning

flashnr [int] If type of trajectory is lightning, the flash number to check the trajectory. 0 means all flash numbers included

__init_subclass__()

This method is called when a class is subclassed.

The default implementation does nothing. It may be overridden to extend subclasses.

```
__le__ ($self, value, /)
     Return self<=value.
__1t__ ($self, value, /)
     Return self<value.
__module__ = 'pyrad.io.trajectory'
__ne__ ($self, value, /)
     Return self!=value.
__new__($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
__reduce__()
     helper for pickle
__reduce_ex__()
     helper for pickle
__repr__($self,/)
     Return repr(self).
___setattr___($self, name, value,/)
     Implement setattr(self, name, value).
\_\_\mathtt{sizeof}\_\_() \rightarrow \mathrm{int}
     size of object in memory, in bytes
__str__($self,/)
     Return str(self).
__subclasshook__()
     Abstract classes can override this to customize issubclass().
     This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImple-
     mented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal
     algorithm (and the outcome is cached).
 _weakref_
     list of weak references to the object (if defined)
_convert_traj_to_swissgrid()
     Convert trajectory samples from WGS84 to Swiss CH1903 coordinates
_get_total_seconds(x)
     Return total seconds of timedelta object
_read_traj()
     Read trajectory from file
_read_traj_lightning(flashnr=0)
     Read trajectory from lightning file
         Parameters
             flashnr [int] the flash number to keep. If 0 data from all flashes will be kept
_read_traj_trt()
     Read trajectory from TRT file
add_radar(radar)
     Add the coordinates (WGS84 longitude, latitude and non WGS84 altitude) of a radar to the radar list.
```

Parameters

```
radar [pyart radar object] containing the radar coordinates
     calculate_velocities (radar)
           Calculate velocities.
     get end time()
           Get time of last trajectory sample.
     get_samples_in_period(start=None, end=None)
           "Get indices of samples of the trajectory within given time period.
     get_start_time()
           Get time of first trajectory sample.
class pyrad.io.trajectory._Radar_Trajectory(lat, lon, alt)
     Bases: object
     A class for holding the trajectory data assigned to a radar.
           Attributes
               latitude [float] WGS84 radar latitude [deg]
               longitude [float] WGS84 radar longitude [deg]
               altitude [float] radar altitude [m] (non WGS84)
               ch_y, ch_x, ch_alt [float] radar coordinates in swiss CH1903 coordinates
               elevation vec [float list] Elevation values of the trajectory samples
               azimuth_vec [float list] Azimuth values of the trajectory samples
               range_vec [float list] Range values of the trajectory samples
               v_abs, v_r, v_el, v_az [array-like] Velocity vectors of the absolute [m/s], radial [m/s], elevation
                   [deg/s] and azimuth [deg/s] velocities
```

Methods

assign_trajectory(el, az, rr)	Assign a trajectory to the radar in polar radar coordinates.
assign_velocity_vecs(v_abs, v_r, v_el,	Assign velocity vectors to the radar.
v_az)	
convert_radpos_to_swissgrid()	Convert the radar location (in WGS84 coordinates)
	to swiss CH1903 coordinates.
	to swiss Ch 1903 coordinates.

```
__class__
alias of builtins.type
__delattr__($self, name,/)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.io.trajectory', '__doc__': '\n A class
__dir__() \rightarrow list
    default dir() implementation
__eq__($self, value,/)
    Return self==value.
```

```
format__()
     default object formatter
__ge__ ($self, value, /)
     Return self>=value.
__getattribute__ ($self, name, /)
     Return getattr(self, name).
__gt__ ($self, value, /)
     Return self>value.
 _hash__($self,/)
     Return hash(self).
___init___(lat, lon, alt)
     Initalize the object.
         Parameters
             lat, lon, alt [radar location coordinates]
             nsamps [number of samples]
__init_subclass__()
     This method is called when a class is subclassed.
     The default implementation does nothing. It may be overridden to extend subclasses.
___le___($self, value,/)
     Return self<=value.
__1t__ ($self, value, /)
     Return self<value.
__module__ = 'pyrad.io.trajectory'
__ne__($self, value, /)
     Return self!=value.
__new__($type, *args, **kwargs)
     Create and return a new object. See help(type) for accurate signature.
___reduce___()
     helper for pickle
__reduce_ex__()
     helper for pickle
 __repr__($self,/)
     Return repr(self).
__setattr__($self, name, value, /)
     Implement setattr(self, name, value).
\_\_\mathtt{sizeof}\_\_() \to \mathrm{int}
     size of object in memory, in bytes
__str__($self,/)
     Return str(self).
__subclasshook__()
     Abstract classes can override this to customize issubclass().
```

This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImplemented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal algorithm (and the outcome is cached).

__weakref_

list of weak references to the object (if defined)

assign_trajectory(el, az, rr)

Assign a trajectory to the radar in polar radar coordinates.

Parameters

el, az, rr [array-like] elevation, azimuth and range vector

assign_velocity_vecs (v_abs, v_r, v_el, v_az)

Assign velocity vectors to the radar.

convert_radpos_to_swissgrid()

Convert the radar location (in WGS84 coordinates) to swiss CH1903 coordinates.

location_is_equal (lat, lon, alt)

Check if the given coordinates are the same.

Parameters

lat, lon, alt [radar location coordinates]

THIRTYFOUR

PYRAD.GRAPH.PLOTS AUX

Auxiliary plotting functions

<pre>get_colobar_label(field_dict, field_name)</pre>	creates the colorbar label using field metadata
<pre>get_field_name(field_dict, field)</pre>	Return a nice field name for a particular field
<pre>get_norm(field_name)</pre>	Computes the normalization of the colormap, and gets
	the ticks and labels of the colorbar from the metadata of
	the field.

Parameters

field_dict [dict] dictionary containing field metadata

field_name [str] name of the field

Returns

label [str] colorbar label

pyrad.graph.plots_aux.get_field_name (field_dict, field)

Return a nice field name for a particular field

Parameters

field_dict [dict] dictionary containing field metadata

field [str] name of the field

Returns

field_name [str] the field name

pyrad.graph.plots_aux.get_norm(field_name)

Computes the normalization of the colormap, and gets the ticks and labels of the colorbar from the metadata of the field. Returns None if the required parameters are not present in the metadata

Parameters

field_name [str] name of the field

Returns

norm [list] the colormap index

ticks [list] the list of ticks in the colorbar

labels [list] the list of labels corresponding to each tick

pyrad library reference for developers, Release 0.0.1	

THIRTYFIVE

PYRAD.GRAPH.PLOTS

Functions to plot Pyrad datasets

plot_density(hist_obj, hist_type,[,])	density plot (angle-values representation)
<pre>plot_scatter(bin_edges1, bin_edges2,[,])</pre>	2D histogram
<pre>plot_quantiles(quant, value, fname_list[,])</pre>	plots quantiles
<pre>plot_histogram(bin_edges, values, fname_list)</pre>	computes and plots histogram
<pre>plot_histogram2(bin_centers, hist, fname_list)</pre>	plots histogram
<pre>plot_antenna_pattern(antpattern, fname_list)</pre>	plots an antenna pattern
<pre>plot_scatter_comp(value1, value2, fname_list)</pre>	plots the scatter between two time series
<pre>plot_sun_hits(field, field_name, fname_list,)</pre>	plots the sun hits

pyrad.graph.plots.plot_antenna_pattern (antpattern, fname_list, labelx='Angle [Deg]', linear=False, twoway=False, title='Antenna Pattern', ymin=None, ymax=None, dpi=72)

plots an antenna pattern

Parameters

antpattern [dict] dictionary with the angle and the attenuation

value [float array] values of the time series

fname list [list of str] list of names of the files where to store the plot

labelx [str] The label of the X axis

linear [boolean] if true data is in linear units

linear [boolean] if true data represents the two way attenuation

titl [str] The figure title

ymin, ymax: float Lower/Upper limit of y axis

dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.plots.plot_density(hist_obj, hist_type, field_name, ind_sweep, prdcfg, fname_list, quantiles=[25.0, 50.0, 75.0], ref_value=0.0, vmin=None, vmax=None)

density plot (angle-values representation)

Parameters

hist_obj [histogram object] object containing the histogram data to plot

```
hist_type [str] type of histogram (instantaneous data or cumulative)
                field_name [str] name of the radar field to plot
                ind_sweep [int] sweep index to plot
                prdcfg [dict] dictionary containing the product configuration
                fname list [list of str] list of names of the files where to store the plot
                quantiles [array] the quantile lines to plot
                ref_value [float] the reference value
                vmin, vmax [float] Minim and maximum extend of the vertical axis
           Returns
                fname_list [list of str] list of names of the created plots
pyrad.graph.plots.plot_histogram(bin_edges,
                                                              values,
                                                                         fname_list,
                                                                                        labelx='bins',
                                                                                                          la-
                                                bely='Number of Samples', titl='histogram', dpi=72)
      computes and plots histogram
           Parameters
                bin_edges [array] histogram bin edges
                values [array] data values
                fname_list [list of str] list of names of the files where to store the plot
                labelx [str] The label of the X axis
                labely [str] The label of the Y axis
                titl [str] The figure title
                dpi [int] dots per inch
           Returns
                fname_list [list of str] list of names of the created plots
pyrad.graph.plots.plot_histogram2 (bin_centers,
                                                                 hist,
                                                                         fname_list,
                                                                                        labelx='bins',
                                                  bely='Number of Samples', titl='histogram', dpi=72,
                                                 ax=None, fig=None, save_fig=True, color=None, al-
                                                 pha=None, invert xaxis=False)
      plots histogram
           Parameters
                bin_centers [array] histogram bin centers
                hist [array] values for each bin
                fname_list [list of str] list of names of the files where to store the plot
                labelx [str] The label of the X axis
                labely [str] The label of the Y axis
                titl [str] The figure title
                dpi [int] dots per inch
                fig [Figure] Figure to add the colorbar to. If none a new figure will be created
                ax [Axis] Axis to plot on. if fig is None a new axis will be created
```

```
save_fig [bool] if true save the figure. If false it does not close the plot and returns the handle to
                    the figure
                color [str] color of the bars
                alpha [float] parameter controling the transparency
                invert xaxis [bool] If true inverts the x axis
           Returns
                fname_list or fig, ax: list of str list of names of the created plots
pyrad.graph.plots.plot_quantiles (quant, value, fname_list, labelx='quantile', labely='value',
                                                titl='quantile', vmin=None, vmax=None, dpi=72)
      plots quantiles
           Parameters
                quant [array] quantiles to be plotted
                value [array] values of each quantile
                fname_list [list of str] list of names of the files where to store the plot
                labelx [str] The label of the X axis
                labely [str] The label of the Y axis
                titl [str] The figure title
                vmin, vmax: float Lower/Upper limit of data values
                dpi [int] dots per inch
           Returns
                fname_list [list of str] list of names of the created plots
pyrad.graph.plots.plot_scatter(bin_edges1, bin_edges2, hist_2d, field_name1, field_name2,
                                                                        metadata=None,
                                                            prdcfg,
                                                                                             lin_regr=None,
                                             fname_list,
                                             lin_regr_slope1=None,
                                                                                  rad1_name='RADAR001',
                                             rad2\_name = 'RADAR002')
      2D histogram
           Parameters
                bin_edges1, bin_edges2 [float array2] the bins of each field
                hist_2d [ndarray 2D] the 2D histogram
                field name1, field name2 [str] the names of each field
                fname list [list of str] list of names of the files where to store the plot
                prdcfg [dict] product configuration dictionary
                metadata [str] a string with metadata to write in the plot
                lin regr [tupple with 2 values] the coefficients for a linear regression
                lin_regr_slope1 [float] the intercep point of a linear regression of slope 1
                rad1_name, rad2_name [str] name of the radars which data is used
           Returns
                fname_list [list of str] list of names of the created plots
```

Parameters

value1 [float array] values of the first time series
value2 [float array] values of the second time series
fname_list [list of str] list of names of the files where to store the plot
labelx [str] The label of the X axis
labely [str] The label of the Y axis
titl [str] The figure title
axis [str] type of axis
metadata [string] a string containing metadata
dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.plots.plot_sun_hits (field, field_name, fname_list, prdcfg)
 plots the sun hits

Parameters

radar [Radar object] object containing the radar data to plot
field_name [str] name of the radar field to plot
altitude [float] the altitude [m MSL] to be plotted
prdcfg [dict] dictionary containing the product configuration
fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

THIRTYSIX

PYRAD.GRAPH.PLOTS_VOL

Functions to plot radar volume data

<pre>plot_ppi(radar, field_name, ind_el, prdcfg,)</pre>	plots a PPI
<pre>plot_ppi_map(radar, field_name, ind_el,)</pre>	plots a PPI on a geographic map
plot_rhi(radar, field_name, ind_az, prdcfg,)	plots an RHI
plot_bscope(radar, field_name, ind_sweep,)	plots a B-Scope (angle-range representation)
<pre>plot_time_range(radar, field_name,)</pre>	plots a time-range plot
plot_cappi(radar, field_name, altitude,)	plots a Constant Altitude Plan Position Indicator CAPPI
plot_traj(rng_traj, azi_traj, ele_traj,)	plots a trajectory on a Cartesian surface
plot_rhi_contour(radar, field_name, ind_az,)	plots contour data on an RHI
plot_ppi_contour(radar, field_name, ind_el,)	plots contour data on a PPI
plot_pos(lat, lon, alt, fname_list[, ax,])	plots a trajectory on a Cartesian surface
plot_rhi_profile(data_list, hvec, fname_list)	plots an RHI profile
plot_along_coord(xval_list, yval_list,)	plots a time series
plot_field_coverage(xval_list, yval_list,)	plots a time series
_plot_time_range(rad_time, rad_range,[,	plots a time-range plot
])	

plots a time-range plot

Parameters

rad_time [Radar object] object containing the radar data to plot

rad_range [str] name of the radar field to plot

rad_data [int] sweep index to plot

field_name [str or None] field name. Used to define plot characteristics

fname_list [list of str] list of names of the files where to store the plot

titl [str] Plot title

xlabel, ylabel [str] x- and y-axis labels

clabel [str or None] colorbar label

vmin, vmax [float] min and max values of the color bar

figsize [list] figure size [xsize, ysize]

```
dpi [int] dpi
```

Returns

```
fname_list [list of str] list of names of the created plots
```

```
pyrad.graph.plots_vol.plot_along_coord(xval_list, yval_list, fname_list, labelx='coord', labely='Value', labels=None, title='Plot along coordinate', colors=None, linestyles=None, ymin=None, ymax=None, dpi=72)
```

plots a time series

Parameters

xval_list [list of float arrays] the x values, range, azimuth or elevation

yval_list [list of float arrays] the y values. Parameter to plot

fname_list [list of str] list of names of the files where to store the plot

labelx [str] The label of the X axis

labely [str] The label of the Y axis

labels [array of str] The label of the legend

title [str] The figure title

colors [array of str] Specifies the colors of each line

linestyles [array of str] Specifies the line style of each line

ymin, ymax: float Lower/Upper limit of y axis

dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_vol.plot_bscope (radar, field_name, ind_sweep, prdcfg, fname_list)
    plots a B-Scope (angle-range representation)
```

Parameters

radar [Radar object] object containing the radar data to plot

field_name [str] name of the radar field to plot

ind sweep [int] sweep index to plot

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_vol.plot_cappi (radar, field_name, altitude, prdcfg, fname_list, save_fig=True)
plots a Constant Altitude Plan Position Indicator CAPPI
```

Parameters

radar [Radar object] object containing the radar data to plot

field_name [str] name of the radar field to plot

altitude [float] the altitude [m MSL] to be plotted

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

save_fig [bool] if true save the figure. If false it does not close the plot and returns the handle to the figure

Returns

fname list [list of str or]

fig, ax [tupple] list of names of the saved plots or handle of the figure an axes

pyrad.graph.plots_vol.plot_field_coverage (xval_list, yval_list, fname_list, labelx='Azimuth (deg)', labely='Range extension [m]', labels=None, title='Field coverage', ymin=None, ymax=None, xmeanval=None, ymeanval=None, labelmeanval=None, dpi=72)

plots a time series

Parameters

xval_list [list of float arrays] the x values, azimuth

yval_list [list of float arrays] the y values. Range extension

fname_list [list of str] list of names of the files where to store the plot

labelx [str] The label of the X axis

labely [str] The label of the Y axis

labels [array of str] The label of the legend

title [str] The figure title

ymin, ymax [float] Lower/Upper limit of y axis

xmeanval, ymeanval [float array] the x and y values of a mean along elevation

labelmeanval [str] the label of the mean

dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_vol.plot_pos (lat, lon, alt, fname_list, ax=None, fig=None, save_fig=True, sort_altitude='No', dpi=72, alpha=1.0, cb_label='height [m MSL]', titl='Position', xlabel='Lon [Deg]', ylabel='Lat [Deg]', limits=None, vmin=None, vmax=None)
```

plots a trajectory on a Cartesian surface

Parameters

lat, lon, alt [float array] Points coordinates

fname_list [list of str] list of names of the files where to store the plot

fig [Figure] Figure to add the colorbar to. If none a new figure will be created

ax [Axis] Axis to plot on. if fig is None a new axis will be created

save_fig [bool] if true save the figure if false it does not close the plot and returns the handle to the figure

```
sort_altitude [str] String indicating whether to sort the altitude data. Can be 'No', 'Low-
                    est_on_top' or 'Highest_on_top'
                dpi [int] Pixel density
                alpha [float] Transparency
                cb label [str] Color bar label
                titl [str] Plot title
                limits [tupple or None] The limits of the field to plot
           Returns
                fname_list [list of str or]
                fig, ax [tupple] list of names of the saved plots or handle of the figure an axes
pyrad.graph.plots_vol.plot_ppi (radar, field_name, ind_el, prdcfg, fname_list, plot_type='PPI',
                                             titl=None, step=None, quantiles=None, save_fig=True)
      plots a PPI
           Parameters
                radar [Radar object] object containing the radar data to plot
                field name [str] name of the radar field to plot
                ind_el [int] sweep index to plot
                prdcfg [dict] dictionary containing the product configuration
                fname_list [list of str] list of names of the files where to store the plot
                plot_type [str] type of plot (PPI, QUANTILES or HISTOGRAM)
                titl [str] Plot title
                step [float] step for histogram plotting
                quantiles [float array] quantiles to plot
                save_fig [bool] if true save the figure. If false it does not close the plot and returns the handle to
                    the figure
           Returns
                fname list [list of str] list of names of the created plots
pyrad.graph.plots_vol.plot_ppi_contour(radar, field_name, ind_el, prdcfg, fname_list,
                                                         contour values=None, linewidths=1.5, ax=None,
                                                         fig=None, save_fig=True)
      plots contour data on a PPI
           Parameters
                radar [Radar object] object containing the radar data to plot
                field_name [str] name of the radar field to plot
                ind_el [int] sweep index to plot
                prdcfg [dict] dictionary containing the product configuration
                fname_list [list of str] list of names of the files where to store the plot
                contour_values [float array] list of contours to plot
                linewidths [float] width of the contour lines
```

```
fig [Figure] Figure to add the colorbar to. If none a new figure will be created
                ax [Axis] Axis to plot on. if fig is None a new axis will be created
                save_fig [bool] if true save the figure if false it does not close the plot and returns the handle to
                    the figure
            Returns
                fname list [list of str or]
                fig, ax [tupple] list of names of the saved plots or handle of the figure an axes
pyrad.graph.plots_vol.plot_ppi_map(radar, field_name, ind_el, prdcfg, fname_list)
      plots a PPI on a geographic map
            Parameters
                radar [Radar object] object containing the radar data to plot
                field_name [str] name of the radar field to plot
                ind_el [int] sweep index to plot
                prdcfg [dict] dictionary containing the product configuration
                fname_list [list of str] list of names of the files where to store the plot
            Returns
                fname list [list of str] list of names of the created plots
pyrad.graph.plots_vol.plot_rhi (radar, field_name, ind_az, prdcfg, fname_list, plot_type='RHI',
                                              titl=None, step=None, quantiles=None, save_fig=True)
      plots an RHI
            Parameters
                radar [Radar object] object containing the radar data to plot
                field_name [str] name of the radar field to plot
                ind_az [int] sweep index to plot
                prdcfg [dict] dictionary containing the product configuration
                fname_list [list of str] list of names of the files where to store the plot
                plot_type [str] type of plot (PPI, QUANTILES or HISTOGRAM)
                titl [str] Plot title
                step [float] step for histogram plotting
                quantiles [float array] quantiles to plot
                save fig [bool] if true save the figure. If false it does not close the plot and returns the handle to
                    the figure
                fname_list [list of str] list of names of the created plots
```

Returns

fig, ax [tupple] list of names of the saved plots or handle of the figure an axes

```
pyrad.graph.plots_vol.plot_rhi_contour(radar, field_name, ind_az, prdcfg, fname_list,
                                               contour_values=None, linewidths=1.5, ax=None,
                                               fig=None, save_fig=True)
```

plots contour data on an RHI

Parameters

```
radar [Radar object] object containing the radar data to plot
```

field_name [str] name of the radar field to plot

ind_az [int] sweep index to plot

prdcfg [dict] dictionary containing the product configuration

fname list [list of str] list of names of the files where to store the plot

contour_values [float array] list of contours to plot

linewidths [float] width of the contour lines

fig [Figure] Figure to add the colorbar to. If none a new figure will be created

ax [Axis] Axis to plot on. if fig is None a new axis will be created

save_fig [bool] if true save the figure if false it does not close the plot and returns the handle to
the figure

Returns

fname_list [list of str or]

fig, ax [tupple] list of names of the saved plots or handle of the figure an axes

```
pyrad.graph.plots_vol.plot_rhi_profile (data_list, hvec, fname_list, labelx='Value', labely='Height (m MSL)', labels=['Mean'], title='RHI profile', colors=None, linestyles=None, vmin=None, vmax=None, hmin=None, hmax=None, dpi=72)
```

plots an RHI profile

Parameters

data_list [list of float array] values of the profile

hvec [float array] height points of the profile

fname_list [list of str] list of names of the files where to store the plot

labelx [str] The label of the X axis

labely [str] The label of the Y axis

labels [array of str] The label of the legend

title [str] The figure title

colors [array of str] Specifies the colors of each line

linestyles [array of str] Specifies the line style of each line

vmin, vmax: float Lower/Upper limit of data values

hmin, hmax: float Lower/Upper limit of altitude

dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_vol.plot_time_range (radar, field_name, ind_sweep, prdcfg, fname_list)
    plots a time-range plot
```

Parameters

```
radar [Radar object] object containing the radar data to plot
```

field_name [str] name of the radar field to plot

ind_sweep [int] sweep index to plot

prdcfg [dict] dictionary containing the product configuration

fname list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

plots a trajectory on a Cartesian surface

Parameters

rng_traj, azi_traj, ele_traj [float array] antenna coordinates of the trajectory [m and deg]

time_traj [datetime array] trajectory time

prdcfg [dict] dictionary containing the product configuration

fname list [list of str] list of names of the files where to store the plot

rad_alt [float or None] radar altitude [m MSL]

rad_tstart [datetime object or None] start time of the radar scan

surface_alt [float] surface altitude [m MSL]

color_ref [str] What the color code represents. Can be 'None', 'rel_altitude', 'altitude' or 'time'

fig [Figure] Figure to add the colorbar to. If none a new figure will be created

ax [Axis] Axis to plot on. if fig is None a new axis will be created

save_fig [bool] if true save the figure if false it does not close the plot and returns the handle to
the figure

Returns

fname_list [list of str or]

fig, ax [tupple] list of names of the saved plots or handle of the figure an axes

pyrad library reference for developers, Release 0.0.1	
pyrau library reference for developers, rielease 0.0.1	

THIRTYSEVEN

PYRAD.GRAPH.PLOTS_GRID

Functions to plot data in a Cartesian grid format

plot_surface(grid, field_name, level,)	plots a surface from gridded data
<pre>plot_latitude_slice(grid, field_name, lon,)</pre>	plots a latitude slice from gridded data
plot_longitude_slice(grid, field_name, lon,	plots a longitude slice from gridded data
)	
<pre>plot_latlon_slice(grid, field_name, coord1,</pre>	plots a croos section crossing two points in the grid
)	

pyrad.graph.plots_grid.plot_latitude_slice (grid, field_name, lon, lat, prdcfg, fname_list)
 plots a latitude slice from gridded data

Parameters

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

lon, lat [float] coordinates of the slice to plot

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

Parameters

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

coord1 [tupple of floats] lat, lon of the first point

coord2 [tupple of floats] lat, lon of the second point

fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.plots_grid.plot_longitude_slice (grid, field_name, lon, lat, prdcfg, fname_list)
 plots a longitude slice from gridded data

Parameters

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

lon, lat [float] coordinates of the slice to plot

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.plots_grid.plot_surface (grid, field_name, level, prdcfg, fname_list)
 plots a surface from gridded data

Parameters

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

level [int] level index

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

Returns

fname_list [list of str] list of names of the created plots

PYRAD.GRAPH.PLOT_TIMESERIES

Functions to plot Pyrad datasets

<pre>plot_timeseries(tvec, data_list, fname_list)</pre>	plots a time series
<pre>plot_timeseries_comp(date1, value1, date2,)</pre>	plots 2 time series in the same graph
<pre>plot_monitoring_ts(date, np_t, cquant,)</pre>	plots a time series of monitoring data
<pre>plot_intercomp_scores_ts(date_vec, np_vec,</pre>	plots a time series of radar intercomparison scores
)	
	plots a time series of melting layer data
- · · · · · · · · · · · · · · · · · · ·	plots a time series of melting layer data plots sun retrieval time series series

```
pyrad.graph.plots_timeseries.plot_intercomp_scores_ts(date_vec, np_vec, mean-
                                                                   bias_vec,
                                                                                      median-
                                                                   bias_vec, quant25bias_vec,
                                                                   quant75bias_vec,
                                                                                       mode-
                                                                   bias_vec,
                                                                                    corr_vec,
                                                                   slope_vec,
                                                                                intercep_vec,
                                                                   intercep_slope1_vec,
                                                                   fname_list,
                                                                                ref_value=0.0,
                                                                   np\_min=0,
                                                                                corr_min=0.0,
                                                                                       UTC',
                                                                   labelx='Time
                                                                   titl='RADAR001-RADAR002
                                                                   intercomparison', dpi=72)
```

plots a time series of radar intercomparison scores

Parameters

date_vec [datetime object] time of the time series

np_vec [int array] number of points

meanbias_vec, medianbias_vec, modebias_vec [float array] mean, median and mode bias

quant25bias_vec, quant75bias_vec: 25th and 75th percentile of the bias

corr_vec [float array] correlation

slope_vec, intercep_vec [float array] slope and intercep of a linear regression

intercep_slope1_vec [float] the intercep point of a inear regression of slope 1

ref_value [float] the reference value

np_min [int] The minimum number of points to consider the result valid

corr_min [float] The minimum correlation to consider the results valid

```
labelx [str] The label of the X axis titl [str] The figure title
```

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_timeseries.plot_ml_ts (dt_ml_arr, ml_top_avg_arr, ml_top_std_arr, thick_avg_arr, thick_std_arr, nrays_valid_arr, nrays_total_arr, fname_list, labelx='Time UTC', titl='Melting layer time series', dpi=72)
```

plots a time series of melting layer data

Parameters

dt_ml_arr [datetime object] time of the time series

np_vec [int array] number of points

meanbias_vec, medianbias_vec, modebias_vec [float array] mean, median and mode bias

quant25bias_vec, quant75bias_vec: 25th and 75th percentile of the bias

corr_vec [float array] correlation

slope_vec, intercep_vec [float array] slope and intercep of a linear regression

intercep_slope1_vec [float] the intercep point of a inear regression of slope 1

ref_value [float] the reference value

np_min [int] The minimum number of points to consider the result valid

corr_min [float] The minimum correlation to consider the results valid

labelx [str] The label of the X axis

titl [str] The figure title

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_timeseries.plot_monitoring_ts (date, np_t, cquant, lquant, hquant, field_name, fname_list, ref_value=None, vmin=None, vmax=None, np_min=0, labelx='Time [UTC]', labely='Value', titl='Time Series', dpi=72)
```

plots a time series of monitoring data

Parameters

date [datetime object] time of the time series

np t [int array] number of points

equant, Iquant, hquant [float array] values of the central, low and high quantiles

field_name [str] name of the field

fname_list [list of str] list of names of the files where to store the plot

ref value [float] the reference value

vmin, vmax [float] The limits of the y axis

np_min [int] minimum number of points to consider the sample plotable

```
labelx [str] The label of the X axis labely [str] The label of the Y axis titl [str] The figure title dpi [int] dots per inch
```

Returns

fname list [list of str] list of names of the created plots

```
pyrad.graph.plots_timeseries.plot_sun_retrieval_ts (sun_retrieval, data_type, fname_list, labelx='Date', titl='Sun retrieval Time Series', dpi=72)
```

plots sun retrieval time series series

Parameters

sun_retrieval [tuple] tuple containing the retrieved parameters

data_type [str] parameter to be plotted

fname_list [list of str] list of names of the files where to store the plot

labelx [str] the x label

titl [str] the title of the plot

dpi [int] dots per inch

Returns

fname_list [list of str] list of names of the created plots

```
pyrad.graph.plots_timeseries.plot_timeseries (tvec, data_list, fname_list, labelx='Time [UTC]', labely='Value', labels=['Sensor'], title='Time Series', period=0, timeformat=None, colors=None, linestyles=None, markers=None, ymin=None, ymax=None, dpi=72)
```

plots a time series

Parameters

tvec [datetime object] time of the time series

data_list [list of float array] values of the time series

fname_list [list of str] list of names of the files where to store the plot

labelx [str] The label of the X axis

labely [str] The label of the Y axis

labels [array of str] The label of the legend

title [str] The figure title

period [float] measurement period in seconds used to compute accumulation. If 0 no accumulation is computed

timeformat [str] Specifies the tvec and time format on the x axis

colors [array of str] Specifies the colors of each line

linestyles [array of str] Specifies the line style of each line

```
markers: array of str Specify the markers to be used for each line
               ymin, ymax: float Lower/Upper limit of y axis
               dpi [int] dots per inch
           Returns
               fname list [list of str] list of names of the created plots
pyrad.graph.plots_timeseries.plot_timeseries_comp(date1, value1, date2,
                                                                        fname_list, labelx='Time [UTC]',
                                                                        labely='Value',
                                                                                           label1='Sensor
                                                                        1', label2='Sensor 2', titl='Time
                                                                        Series Comparison', period1=0, pe-
                                                                        riod2=0, ymin=None, ymax=None,
                                                                        dpi=72)
      plots 2 time series in the same graph
           Parameters
               date1 [datetime object] time of the first time series
               value1 [float array] values of the first time series
               date2 [datetime object] time of the second time series
               value2 [float array] values of the second time series
               fname_list [list of str] list of names of the files where to store the plot
               labelx [str] The label of the X axis
               labely [str] The label of the Y axis
               label1, label2 [str] legend label for each time series
               titl [str]
                      The figure title
                   period1, period2 [float] measurement period in seconds used to compute accumulation. If
                      0 no accumulation is computed
               dpi [int] dots per inch
               ymin, ymax [float] The limits of the Y-axis. None will keep the default limit.
           Returns
```

fname_list [list of str] list of names of the created plots

THIRTYNINE

PYRAD.UTIL.RADAR_UTILS

Miscellaneous functions dealing with radar data

get_ROI(radar, fieldname, sector)	filter out any data outside the region of interest defined
	by sector
rainfall_accumulation(t_in_vec, val_in_vec)	Computes the rainfall accumulation of a time series over
	a given period
time_series_statistics(t_in_vec, val_in_vec)	Computes statistics over a time-averaged series
<pre>join_time_series(t1, val1, t2, val2[, dropnan])</pre>	joins time_series
<pre>get_range_bins_to_avg(rad1_rng, rad2_rng)</pre>	Compares the resolution of two radars and determines
	if and which radar has to be averaged and the length of
	the averaging window
belongs_roi_indices(lat, lon, roi)	Get the indices of points that belong to roi in a list of
	points
find_ray_index(ele_vec, azi_vec, ele, azi[,])	Find the ray index corresponding to a particular eleva-
	tion and azimuth
<pre>find_rng_index(rng_vec, rng[, rng_tol])</pre>	Find the range index corresponding to a particular range
<pre>find_nearest_gate(radar, lat, lon[, latlon_tol])</pre>	Find the radar gate closest to a lat,lon point
find_neighbour_gates(radar, azi, rng[,])	Find the neighbouring gates within +-delta_azi and +-
	delta_rng
find_colocated_indexes(radar1, radar2,)	Given the theoretical elevation, azimuth and range of
	the co-located gates of two radars and a given tolerance
	returns the indices of the gates for the current radars
get_target_elevations(radar_in)	Gets RHI taget elevations
time_avg_range(timeinfo, avg_starttime,)	finds the new start and end time of an averaging
get_closest_solar_flux(hit_datetime_list,	finds the solar flux measurement closest to the sun hit
)	
create_sun_hits_field(rad_el, rad_az,)	creates a sun hits field from the position and power of
010000_0011_1100_11010(110_01,110_112,111)	the sun hits
create_sun_retrieval_field(par,	creates a sun retrieval field from the retrieval parameters
field_name,)	parameters
compute_quantiles(field[, quantiles])	computes quantiles
compute_quantiles_from_hist(bin_centers,	computes quantiles from histograms
hist)	computes quantities from instograms
compute_quantiles_sweep(field, ray_start,)	computes quantiles of a particular sweep
compute_histogram(field, field_name[,])	computes histogram of the data
compute_histogram_sweep(field, ray_start,)	computes histogram of the data in a particular sweep
get_histogram_bins(field_name[, step])	gets the histogram bins using the range limits of the field
get_nrstogram_brns(neid_name[, step])	as defined in the Py-ART config file.
a compart a find a total (field) find (find)	<u> </u>
$compute_2d_stats(field1, field2,[,])$	computes a 2D histogram and statistics of the data
	Continued on next page

Table 1 – continued from previous page

compute_1d_stats(field1, field2)	returns statistics of data
<pre>compute_2d_hist(field1, field2, field_name1,)</pre>	computes a 2D histogram of the data
quantize_field(field, field_name, step)	quantizes data
compute_profile_stats(field, gate_altitude,	Compute statistics of vertical profile
)	
<pre>compute_directional_stats(field[, avg_type,</pre>	Computes the mean or the median along one of the axis
])	(ray or range)
<pre>project_to_vertical(data_in, data_height,)</pre>	Projects radar data to a regular vertical grid

pyrad.util.radar_utils.belongs_roi_indices(lat, lon, roi)

Get the indices of points that belong to roi in a list of points

Parameters

lat, lon [float arrays] latitudes and longitudes to checkroi [dict] Dictionary describing the region of interest

Returns

inds [array of ints] list of indices of points belonging to ROI

is_roi [str] Whether the list of points is within the region of interest. Can be 'All', 'None', 'Some'

pyrad.util.radar_utils.compute_1d_stats (field1, field2)
 returns statistics of data

Parameters

field1, field2 [ndarray 1D] the two fields to compare

Returns

stats [dict] a dictionary with statistics

Parameters

field1, field2 [ndarray 2D] the radar fields
field_name1, field_name2 [str] field names
step1, step2 [float] size of the bins

Returns

f H [float array 2D] The bi-dimensional histogram of samples x and y

xedges, yedges [float array] the bin edges along each dimension

pyrad.util.radar_utils.compute_2d_stats(field1, field2, field_name1, field_name2, step1=None, step2=None)

computes a 2D histogram and statistics of the data

Parameters

field1, field2 [ndarray 2D] the two fields
field_name1, field_nam2: str the name of the fields
step1, step2 [float] size of bin

```
Returns
               hist_2d [array] the histogram
               bin_edges1, bin_edges2 [float array] The bin edges
               stats [dict] a dictionary with statistics
pyrad.util.radar_utils.compute_directional_stats (field,
                                                                                      avg_type='mean',
                                                                    nvalid min=1, axis=0)
     Computes the mean or the median along one of the axis (ray or range)
           Parameters
               field [ndarray] the radar field
               avg_type :str the type of average: 'mean' or 'median'
               nvalid min [int] the minimum number of points to consider the stats valid. Default 1
               axis [int] the axis along which to compute (0=ray, 1=range)
           Returns
               values [ndarray 1D] The resultant statistics
               nvalid [ndarray 1D] The number of valid points used in the computation
pyrad.util.radar_utils.compute_histogram(field, field_name, bin_edges=None, step=None,
                                                         vmin=None, vmax=None)
     computes histogram of the data
           Parameters
               field [ndarray 2D] the radar field
               field name: str or none name of the field
               bins edges :ndarray 1D the bin edges
               step [float] size of bin
               vmin, vmax [float] The minimum and maximum value of the histogram
           Returns
               bin_edges [float array] interval of each bin
               values [float array] values at each bin
pyrad.util.radar_utils.compute_histogram_sweep (field, ray_start, ray_end, field_name,
                                                                 step=None)
     computes histogram of the data in a particular sweep
           Parameters
               field [ndarray 2D] the radar field
               ray_start, ray_end [int] starting and ending ray indexes
               field_name: str name of the field
               step [float] size of bin
           Returns
               bin_edges [float array] interval of each bin
               values [float array] values at each bin
```

```
pyrad.util.radar_utils.compute_profile_stats (field, gate_altitude, h_vec, h_res, quan-
                                                               tity='quantiles',
                                                                                 quantiles=array([0.25,
                                                               0.5, 0.75]), nvalid min=4, std field=None,
                                                                                     make_linear=False,
                                                               np_field=None,
                                                               include nans=False)
     Compute statistics of vertical profile
           Parameters
               field [ndarray] the radar field
               gate altitude: ndarray the altitude at each radar gate [m MSL]
               h_vec [1D ndarray] height vector [m MSL]
               h_res [float] heigh resolution [m]
               quantity [str] The quantity to compute. Can be ['quantiles', 'mode', 'regression_mean',
                   'mean']. If 'mean', the min, max, and average is computed.
               quantiles [1D ndarray] the quantiles to compute
               nvalid_min [int] the minimum number of points to consider the stats valid
               std_field [ndarray] the standard deviation of the regression at each range gate
               np field [ndarray] the number of points used to compute the regression at each range gate
               make_linear [Boolean] If true the data is transformed into linear coordinates before taking the
                   mean
               include_nans [Boolean] If true NaN will be considered as zeros
           Returns
               vals [ndarray 2D] The resultant statistics
               val_valid [ndarray 1D] The number of points to compute the stats used at each height level
pyrad.util.radar_utils.compute_quantiles(field, quantiles=None)
     computes quantiles
           Parameters
               field [ndarray 2D] the radar field
               ray_start, ray_end [int] starting and ending ray indexes
               quantiles: float array list of quantiles to compute
           Returns
               quantiles [float array] list of quantiles
               values [float array] values at each quantile
pyrad.util.radar_utils.compute_quantiles_from_hist (bin_centers,
                                                                                         hist.
                                                                                                   quan-
                                                                        tiles=None)
     computes quantiles from histograms
           Parameters
               bin_centers [ndarray 1D] the bins
               hist [ndarray 1D] the histogram
               quantiles: float array list of quantiles to compute
           Returns
```

```
quantiles [float array] list of quantiles
               values [float array] values at each quantile
pyrad.util.radar_utils.compute_quantiles_sweep (field,
                                                                           ray_start,
                                                                                       ray_end,
                                                                                                   quan-
                                                                  tiles=None)
     computes quantiles of a particular sweep
           Parameters
               field [ndarray 2D] the radar field
               ray_start, ray_end [int] starting and ending ray indexes
               quantiles: float array list of quantiles to compute
           Returns
               quantiles [float array] list of quantiles
               values [float array] values at each quantile
pyrad.util.radar_utils.create_sun_hits_field(rad_el, rad_az, sun_el, sun_az, data,
                                                                imgcfg)
     creates a sun hits field from the position and power of the sun hits
           Parameters
               rad el, rad az, sun el, sun az [ndarray 1D] azimuth and elevation of the radar and the sun
                   respectively in degree
               data [masked ndarray 1D] the sun hit data
               imgcfg: dict a dictionary specifying the ranges and resolution of the field to create
           Returns
               field [masked ndarray 2D] the sun hit field
pyrad.util.radar_utils.create_sun_retrieval_field(par, field_name, imgcfg, lant=0.0)
     creates a sun retrieval field from the retrieval parameters
           Parameters
               par [ndarray 1D] the 5 retrieval parameters
               imgcfg: dict a dictionary specifying the ranges and resolution of the field to create
           Returns
               field [masked ndarray 2D] the sun retrieval field
pyrad.util.radar_utils.find_colocated_indexes(radar1, radar2, rad1_ele, rad1_azi,
                                                                 rad1 rng, rad2 ele, rad2 azi, rad2 rng,
                                                                 ele_tol=0.5, azi_tol=0.5, rng_tol=50.0)
     Given the theoretical elevation, azimuth and range of the co-located gates of two radars and a given tolerance
     returns the indices of the gates for the current radars
           Parameters
               radar1, radar2 [radar objects] the two radar objects
               rad1_ele, rad1_azi, rad1_rng [array of floats] the radar coordinates of the radar1 gates
               rad2_ele, rad2_azi, rad2_rng [array of floats] the radar coordinates of the radar2 gates
               ele_tol, azi_tol [floats] azimuth and elevation angle tolerance [deg]
```

rng tol [float] range Tolerance [m]

Returns

```
ind_ray_rad1, ind_rng_rad1, ind_ray_rad2, ind_rng_rad2 [array of ints] the ray and range
indexes of each radar gate
```

```
\verb|pyrad.util.radar_utils.find_nearest_gate| (\textit{radar}, \textit{lat}, \textit{lon}, \textit{latlon\_tol} = 0.0005)|
```

Find the radar gate closest to a lat,lon point

Parameters

radar [radar object] the radar object

lat, lon [float] The position of the point

latlon_tol [float] The tolerance around this point

Returns

ind_ray, ind_rng [int] The ray and range index

azi, rng [float] the range and azimuth position of the gate

Find the neighbouring gates within +-delta_azi and +-delta_rng

Parameters

radar [radar object] the radar object

azi, rng [float] The azimuth [deg] and range [m] of the central gate

delta_azi, delta_rng [float] The extend where to look for

Returns

inds_ray_aux, ind_rng_aux [int] The indices (ray, rng) of the neighbouring gates

```
pyrad.util.radar_utils.find_ray_index(ele_vec, azi_vec, ele, azi, ele_tol=0.0, azi_tol=0.0, nearest='azi')
```

Find the ray index corresponding to a particular elevation and azimuth

Parameters

ele vec, azi vec [float arrays] The elevation and azimuth data arrays where to look for

ele, azi [floats] The elevation and azimuth to search

ele_tol, azi_tol [floats] Tolerances [deg]

nearest [str] criteria to define wich ray to keep if multiple rays are within tolerance. azi: nearest azimuth, ele: nearest elevation

Returns

ind_ray [int] The ray index

```
pyrad.util.radar_utils.find_rng_index(rng_vec, rng, rng_tol=0.0)
```

Find the range index corresponding to a particular range

Parameters

rng_vec [float array] The range data array where to look for

rng [float] The range to search

rng_tol [float] Tolerance [m]

Returns

```
ind_rng [int] The range index
pyrad.util.radar_utils.get_ROI (radar, fieldname, sector)
     filter out any data outside the region of interest defined by sector
           Parameters
               radar [radar object] the radar object where the data is
               fieldname [str] name of the field to filter
               sector [dict] a dictionary defining the region of interest
           Returns
               roi flag [ndarray] a field array with ones in gates that are in the Region of Interest
pyrad.util.radar_utils.get_closest_solar_flux(hit_datetime_list,
                                                                                       flux_datetime_list,
                                                                flux_value_list)
     finds the solar flux measurement closest to the sun hit
           Parameters
               hit_datetime_list [datetime array] the date and time of the sun hit
               flux datetime list [datetime array] the date and time of the solar flux measurement
               flux value list: ndarray 1D the solar flux values
           Returns
               flux_datetime_closest_list [datetime array] the date and time of the solar flux measurement
                   closest to sun hit
               flux value closest list [ndarray 1D] the solar flux values closest to the sun hit time
pyrad.util.radar_utils.get_histogram_bins(field_name, step=None)
     gets the histogram bins using the range limits of the field as defined in the Py-ART config file.
           Parameters
               field name: str name of the field
               step [float] size of bin
           Returns
               bin edges [float array] The bin edges
pyrad.util.radar_utils.get_range_bins_to_avg (rad1_rng, rad2_rng)
     Compares the resolution of two radars and determines if and which radar has to be averaged and the length of
     the averaging window
           Parameters
               rad1 rng [array] the range of radar 1
               rad2_rng [datetime] the range of radar 2
           Returns
               avg_rad1, avg_rad2 [Boolean] Booleans specifying if the radar data has to be average in range
               avg_rad_lim [array with two elements] the limits to the average (centered on each range gate)
pyrad.util.radar_utils.get_target_elevations(radar_in)
```

Parameters

Gets RHI taget elevations

```
radar_in [Radar object] current radar object
           Returns
               target_elevations [1D-array] Azimuth angles
               el_tol [float] azimuth tolerance
pyrad.util.radar_utils.join_time_series(t1, val1, t2, val2, dropnan=False)
     joins time_series
           Parameters
               t1 [datetime array] time of first series
               val1 [float array] value of first series
               t2 [datetime array] time of second series
               val2 [float array] value of second series
               dropnan [boolean] if True remove NaN from the time series
           Returns
               t_out_vec [datetime array] the resultant date time after joining the series
               val1_out_vec [float array] value of first series
               val2_out_vec [float array] value of second series
pyrad.util.radar_utils.project_to_vertical(data_in,
                                                                         data height,
                                                                                        grid_height,
                                                                                                        in-
                                                             terp kind='none', fill value=-9999.0)
     Projects radar data to a regular vertical grid
           Parameters
               data_in [ndarray 1D] the radar data to project
               data_height [ndarray 1D] the height of each radar point
               grid_height [ndarray 1D] the regular vertical grid to project to
               interp_kind [str] The type of interpolation to use: 'none' or 'nearest'
               fill_value [float] The fill value used for interpolation
           Returns
               data out [ndarray 1D] The projected data
pyrad.util.radar_utils.quantize_field(field, field_name, step)
     quantizes data
           Parameters
               field [ndarray 2D] the radar field
               field_name: str name of the field
               step [float] size of bin
           Returns
               fieldq [ndarray 2D] The quantized field
               values [float array] values at each bin
```

```
pyrad.util.radar_utils.rainfall_accumulation(t_in_vec, val_in_vec, cum_time=3600.0,
                                                              base time=0.0, dropnan=False)
     Computes the rainfall accumulation of a time series over a given period
           Parameters
               t_in_vec [datetime array] the input date and time array
               val_in_vec [float array] the input values array [mm/h]
               cum time [int] accumulation time [s]
               base time [int] base time [s]
               dropnan [boolean] if True remove NaN from the time series
           Returns
               t_out_vec [datetime array] the output date and time array
               val_out_vec [float array] the output values array
               np_vec [int array] the number of samples at each period
pyrad.util.radar_utils.time_avg_range(timeinfo, avg_starttime, avg_endtime, period)
     finds the new start and end time of an averaging
           Parameters
               timeinfo [datetime] the current volume time
               avg_starttime [datetime] the current average start time
               avg endtime: datetime the current average end time
               period: float the averaging period
           Returns
               new_starttime [datetime] the new average start time
               new_endtime [datetime] the new average end time
pyrad.util.radar_utils.time_series_statistics(t_in_vec, val_in_vec, avg_time=3600,
                                                                base_time=1800, method='mean', drop-
                                                                nan=False)
     Computes statistics over a time-averaged series
           Parameters
               t_in_vec [datetime array] the input date and time array
               val_in_vec [float array] the input values array
               avg_time [int] averaging time [s]
               base_time [int] base time [s]
               method [str] statistical method
               dropnan [boolean] if True remove NaN from the time series
           Returns
               t_out_vec [datetime array] the output date and time array
               val out vec [float array] the output values array
```
