PYRAD.FLOW.FLOW_CONTROL

functions to control the Pyrad data processing flow

main(cfgfile[, starttime, endtime,])	main flow control. Processes radar data off-line over a pe-
	riod of time
<pre>main_rt(cfgfile_list[, starttime, endtime,])</pre>	main flow control. Processes radar data in real time. The
	start and end
_initialize_listener()	initialize the input listener
_user_input_listener(input_queue)	Permanently listens to the keyword input until the user
	types "Return"
_get_times_and_traj(trajfile, starttime,)	Gets the trajectory and the start time and end time if they
	have
initialize_datasets(dataset_levels, cfg[,])	Initializes datasets.
_process_datasets(dataset_levels, cfg,)	Processes the radar volumes for a particular time stamp.
_postprocess_datasets(dataset_levels, cfg, dscfg)	Processes the radar volumes for a particular time stamp.
_wait_for_files(nowtime, datacfg, datatype_list)	Waits for the master file and all files in a volume scan to
	be present returns the masterfile if the volume scan can be
	processed.
_get_radars_data(master_voltime,[,])	Get the radars data.
_generate_dataset(dsname, cfg, dscfg[,])	generates a new dataset
_generate_dataset_mp(dsname, cfg, dscfg,)	generates a new dataset using multiprocessing
_process_dataset(cfg, dscfg[, proc_status,])	processes a dataset
_generate_prod(dataset, cfg, prdname,[,])	generates a product
_create_cfg_dict(cfgfile)	creates a configuration dictionary
create_datacfg_dict(cfg)	creates a configuration dictionary creates a data configuration dictionary from a config dictio-
_create_datacfg_dict(cfg) _create_dscfg_dict(cfg, dataset[, voltime])	creates a data configuration dictionary from a config dictio-
_create_datacfg_dict(cfg)	creates a data configuration dictionary from a config dictionary
_create_datacfg_dict(cfg) _create_dscfg_dict(cfg, dataset[, voltime])	creates a data configuration dictionary from a config dictionary creates a dataset configuration dictionary
_create_datacfg_dict(cfg) _create_dscfg_dict(cfg, dataset[, voltime]) _create_prdcfg_dict(cfg, dataset, product,)	creates a data configuration dictionary from a config dictionary creates a dataset configuration dictionary creates a product configuration dictionary
create_datacfg_dict(cfg) create_dscfg_dict(cfg, dataset[, voltime]) create_prdcfg_dict(cfg, dataset, product,) get_datatype_list(cfg[, radarnr]) get_datasets_list(cfg) get_masterfile_list(datatypesdescr,[,])	creates a data configuration dictionary from a config dictionary creates a dataset configuration dictionary creates a product configuration dictionary get list of unique input data types
_create_datacfg_dict(cfg) _create_dscfg_dict(cfg, dataset[, voltime]) _create_prdcfg_dict(cfg, dataset, product,) _get_datatype_list(cfg[, radarnr]) _get_datasets_list(cfg)	creates a data configuration dictionary from a config dictionary creates a dataset configuration dictionary creates a product configuration dictionary get list of unique input data types get list of dataset at each processing level

pyrad.flow.flow_control._add_dataset (new_dataset, radar_list, ind_rad, make_global=True)
 adds a new field to an existing radar object

Parameters new_dataset : radar object

the radar object containing the new fields

radar: radar object

```
the radar object containing the global data
               make_global: boolean
                   if true a new field is added to the global data
          Returns 0 if successful. None otherwise
pyrad.flow.flow_control._create_cfg_dict(cfgfile)
     creates a configuration dictionary
          Parameters cfgfile: str
                   path of the main config file
          Returns cfg: dict
                  dictionary containing the configuration data
pyrad.flow.flow_control._create_datacfg_dict(cfg)
     creates a data configuration dictionary from a config dictionary
          Parameters cfg: dict
                   config dictionary
          Returns datacfg: dict
                  data config dictionary
pyrad.flow.flow_control._create_dscfg_dict(cfg, dataset, voltime=None)
     creates a dataset configuration dictionary
          Parameters cfg: dict
                  config dictionary
               dataset : str
                   name of the dataset
               voltime: datetime object
                   time of the dataset
          Returns dscfg: dict
                  dataset config dictionary
pyrad.flow.flow_control._create_prdcfg_dict(cfg,
                                                                  dataset,
                                                                             product,
                                                                                       voltime,
                                                            info=None)
     creates a product configuration dictionary
          Parameters cfg: dict
                  config dictionary
               dataset : str
                   name of the dataset used to create the product
               product : str
                   name of the product
               voltime: datetime object
                  time of the dataset
          Returns prdcfg: dict
```

```
product config dictionary
pyrad.flow.flow_control._generate_dataset (dsname,
                                                                        cfg,
                                                                                dscfg,
                                                                                          proc\_status=0,
                                                           radar_list=None,
                                                                                voltime=None,
                                                                                                  trajec-
                                                           tory=None, runinfo=None)
     generates a new dataset
           Parameters dsname: str
                   name of the dataset
               cfg: dict
                   configuration data
               dscfg: dict
                   dataset configuration data
               proc_status : int
                   processing status 0: init 1: processing 2: final
               radar_list: list
                   a list containing the radar objects
               voltime: datetime
                   reference time of the radar(s)
               trajectory: trajectory object
                   trajectory object
               runinfo: str
                   string containing run info
           Returns new_dataset : dataset object
                   The new dataset generated. None otherwise
               ind_rad: int
                   the index to the reference radar object
               jobs: list
                   list of processes used to generate products. (Empty)
pyrad.flow.flow_control._generate_dataset_mp (dsname,
                                                                            cfg,
                                                                                    dscfg,
                                                                                              out_queue,
                                                               proc\_status=0,
                                                                                        radar_list=None,
                                                                voltime=None,
                                                                                trajectory=None,
                                                                info=None)
     generates a new dataset using multiprocessing
           Parameters dsname: str
                   name of the dataset
               cfg: dict
                   configuration data
               dscfg: dict
                   dataset configuration data
```

out_queue : queue object

```
the queue object where to put the output data
                proc_status : int
                    processing status 0: init 1: processing 2: final
                radar_list: list
                    a list containing the radar objects
                voltime: datetime
                    reference time of the radar(s)
                trajectory: trajectory object
                    trajectory object
                runinfo: str
                    string containing run info
           Returns new_dataset : dataset object
                    The new dataset generated. None otherwise
                ind_rad: int
                    the index to the reference radar object
                make global: boolean
                    A flag indicating whether the dataset must be made global
               jobs: list
                    list of processes used to generate products
pyrad.flow.flow_control._generate_prod(dataset, cfg, prdname, prdfunc, dsname, voltime,
                                                        runinfo=None)
      generates a product
           Parameters dataset : object
                    the dataset object
                cfg: dict
                    configuration data
                prdname: str
                    name of the product
                prdfunc: func
                    name of the product processing function
                dsname: str
                    name of the dataset
                voltime: datetime object
                    reference time of the radar(s)
                runinfo: str
                    string containing run info
           Returns cfg: dict
```

```
dictionary containing the configuration data
pyrad.flow.flow_control._get_datasets_list(cfg)
     get list of dataset at each processing level
           Parameters cfg: dict
                   config dictionary
           Returns dataset_levels: dict
                   a dictionary containing the list of datasets at each processing level
pyrad.flow.flow_control._get_datatype_list(cfg, radarnr='RADAR001')
     get list of unique input data types
           Parameters cfg: dict
                   config dictionary
               radarnr: str
                   radar number identifier
           Returns datatypesdescr : list
                   list of data type descriptors
pyrad.flow.flow_control._get_masterfile_list (datatypesdescr, starttime, endtime, datacfg,
                                                               scan list=None)
     get master file list
           Parameters datatypesdescr: list
                   list of unique data type descriptors
               starttime, endtime : datetime object
                   start and end of processing period
               datacfg: dict
                   data configuration dictionary
               scan_list: list
                   list of scans
           Returns masterfilelist: list
                   the list of master files
               masterdatatypedescr: str
                   the master data type descriptor
pyrad.flow.flow_control._get_radars_data(master_voltime,
                                                                          datatypesdescr_list, datacfg,
                                                         num\ radars=1)
     Get the radars data.
           Parameters master_voltime : datetime object
                   reference time
               datatypesdescr_list : list of lists
                   List of the raw data types to get from each radar
               datacfg: dict
```

```
dictionary containing the parameters to get the radar data
           Returns radar_list: list
                    a list containing the radar objects
pyrad.flow.flow_control._get_times_and_traj(trajfile, starttime, endtime, scan_period,
                                                               last state file=None,
                                                                                          trajtype='plane',
                                                               flashnr=0
      Gets the trajectory and the start time and end time if they have not been set
           Parameters trajfile: str
                    trajectory file
               starttime, endtime: datetime object or None
                    the start and stop times of the processing
               scan_period : float
                    the scan period in minutes
               last_state_file : str
                   name of the file that stores the time of the last processed volume
               trajtype: str
                   type of trajectory. Can be plane or lightning
               flashnr: int
                    If type of trajectory is lightning, the flash number. 0 means all flash numbers included
pyrad.flow.flow_control._initialize_datasets(dataset_levels,
                                                                                   cfg,
                                                                                          traj=None,
                                                                                                         in-
                                                                 fostr=None)
      Initializes datasets. Creates the data set configuration dictionary
           Parameters dataset_levels : dict
                   dictionary containing the list of data sets to be generated at each processing level
               cfg: dict
                    processing configuration dictionary
               traj: trajectory object
                    object containing the trajectory
               infostr: str
                    Information string about the actual data processing (e.g. 'RUN57'). This string is added
                   to product files.
           Returns dscfg: dict
                   dictionary containing the configuration data for each dataset
               traj: trajectory object
                    the modified trajectory object
pyrad.flow.flow_control._initialize_listener()
      initialize the input listener
           Returns input_queue : queue object
                    the queue object where to put the quit signal
```

```
pyrad.flow.flow_control._postprocess_datasets (dataset_levels, cfg, dscfg, traj=None, in-
                                                                  fostr=None)
      Processes the radar volumes for a particular time stamp.
           Parameters dataset levels: dict
                    dictionary containing the list of data sets to be generated at each processing level
               cfg: dict
                   processing configuration dictionary
               dscfg: dict
                    dictionary containing the configuration data for each dataset
               traj: trajectory object
                    and object containing the trajectory
               infostr: str
                    Information string about the actual data processing (e.g. 'RUN57'). This string is added
                   to product files.
           Returns dscfg: dict
                    the modified configuration dictionary
               traj: trajectory object
                    the modified trajectory object
pyrad.flow.flow_control._process_dataset(cfg, dscfg, proc_status=0, radar_list=None,
                                                           voltime=None, trajectory=None, runinfo=None)
      processes a dataset
           Parameters cfg: dict
                   configuration dictionary
               dscfg: dict
                    dataset specific configuration dictionary
               proc_status : int
                    status of the processing 0: Initialization 1: process of radar volume 2: Final processing
               radar_list : list
                   list of radar objects containing the data to be processed
               voltime: datetime object
                    reference time of the radar(s)
               trajectory: Trajectory object
                   containing trajectory samples
               runinfo: str
                   string containing run info
           Returns new_dataset : dataset object
                    The new dataset generated. None otherwise
               ind_rad: int
```

```
the index to the reference radar object
               jobs: list
                   a list of processes used to generate products
pyrad.flow.flow_control._process_datasets(dataset_levels, cfg, dscfg, radar_list, mas-
                                                            ter voltime, traj=None, infostr=None)
     Processes the radar volumes for a particular time stamp.
           Parameters dataset levels: dict
                   dictionary containing the list of data sets to be generated at each processing level
               cfg: dict
                   processing configuration dictionary
               dscfg: dict
                   dictionary containing the configuration data for each dataset
               radar_list : list of radar objects
                   The radar objects to be processed
               master_voltime : datetime object
                   the reference radar volume time
               traj: trajectory object
                   and object containing the trajectory
               infostr: str
                   Information string about the actual data processing (e.g. 'RUN57'). This string is added
                   to product files.
           Returns dscfg: dict
                   the modified configuration dictionary
               traj: trajectory object
                   the modified trajectory object
pyrad.flow.flow_control._user_input_listener(input_queue)
     Permanently listens to the keyword input until the user types "Return"
           Parameters input_queue : queue object
                   the queue object where to put the quit signal
pyrad.flow.flow_control._wait_for_files (nowtime,
                                                                            datacfg,
                                                                                              datatype_list,
                                                         last processed=None)
     Waits for the master file and all files in a volume scan to be present returns the masterfile if the volume scan can
     be processed.
           Parameters nowtime: datetime object
                   the current time
               datacfg: dict
                   dictionary containing the parameters to get the radar data
               last_processed : datetime or None
                   The end time of the previously processed radar volume
```

```
Returns masterfile: str or None
                    name of the master file. None if the volume was not complete
               masterdatatypedescr: str
                    the description of the master data type
               last processed: datetime
                    True of all scans found
pyrad.flow.flow_control._wait_for_rainbow_datatypes(rainbow_files, period=30)
      waits until the files for all rainbow data types are present.
           Parameters rainbow files: list of strings
                    a list containing the names of all the rainbow files to wait for
               period: int
                    the time it has to wait (s)
           Returns found all: Boolean
                    True if all files were present. False otherwise
pyrad.flow.flow_control._warning_format (message, category, filename, lineno, file=None,
                                                          line=None)
                                                                                          trajfile='',
pyrad.flow.flow_control.main(cfgfile,
                                                    starttime=None,
                                                                       endtime=None,
                                          type='plane', flashnr=0, infostr='')
      main flow control. Processes radar data off-line over a period of time given either by the user, a trajectory file, or
      determined by the last volume processed and the current time. Multiple radars can be processed simultaneously
           Parameters cfgfile: str
                    path of the main config file
               starttime, endtime: datetime object
                    start and end time of the data to be processed
               trajfile: str
                    path to file describing the trajectory
               trajtype: str
                    type of trajectory file. Can be either 'plane' or 'lightning'
               flashnr: int
                    If larger than 0 will select a flash in a lightning trajectory file. If 0 the data corresponding
                    to the trajectory of all flashes will be plotted
               infostr: str
                    Information string about the actual data processing (e.g. 'RUN57'). This string is added
                    to product files.
pyrad.flow.flow_control.main_rt (cfgfile_list, starttime=None, endtime=None, infostr_list=None,
                                              proc_period=60, proc_finish=None)
      main flow control. Processes radar data in real time. The start and end processing times can be determined by
      the user. This function is inteded for a single radar
           Parameters cfgfile_list : list of str
```

path of the main config files

starttime, endtime : datetime object

start and end time of the data to be processed

infostr_list : list of str

Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

proc_period: int

period of time before starting a new processing round (seconds)

cronjob_controlled: Boolean

If True means that the program is started periodically from a cronjob and therefore finishes execution after processing

proc_finish: int or None

if set to a value the program will be forced to shut down after the value (in seconds) from start time has been exceeded

Returns end_proc: Boolean

If true the program has ended successfully

CHAPTER

TWO

PYRAD.PROC.PROCESS_AUX

Auxiliary functions. Functions to determine the process type, pass raw data to the product generation functions, save radar data and extract data at determined points or regions of interest.

get_process_func(dataset_type, dsname)	maps the dataset type into its processing function and data
	set format
process_raw(procstatus, dscfg[, radar_list])	dummy function that returns the initial input data set
process_save_radar(procstatus, dscfg[,])	dummy function that allows to save the entire radar object
<pre>process_point_measurement(procstatus, dscfg)</pre>	Obtains the radar data at a point measurement
process_grid(procstatus, dscfg[, radar_list])	Puts the radar data in a regular grid
process_qvp(procstatus, dscfg[, radar_list])	Computes quasi vertical profiles
process_time_height(procstatus, dscfg[,])	Produces time height radar objects at a point of interest de-
	fined by

pyrad.proc.process_aux.get_process_func (dataset_type, dsname) maps the dataset type into its processing function and data set format

Parameters dataset_type : str

data set type, i.e. 'RAW', 'SAN', etc.

dsname: str

Name of dataset

Returns func_name : str or function

pyrad function used to process the data set type

dsformat : str

data set format, i.e.: 'VOL', etc.

pyrad.proc.process_aux.process_grid(procstatus, dscfg, radar_list=None)

Puts the radar data in a regular grid

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

gridconfig [dictionary. Dataset keyword] Dictionary containing some or all of this keywords: xmin, xmax, ymin, ymax, zmin, zmax : floats

minimum and maximum horizontal distance from grid origin [km] and minimum and maximum vertical distance from grid origin [m] Defaults -40, 40, -40, 40, 0., 10000.

hres, vres [floats] horizontal and vertical grid resolution [m] Defaults 1000., 500.

latorig, lonorig, altorig [floats] latitude and longitude of grid origin [deg] and altitude of grid origin [m MSL] Defaults the latitude, longitude and altitude of the radar

wfunc [str] the weighting function used to combine the radar gates close to a grid point. Possible values BARNES, CRESSMAN, NEAREST_NEIGHBOUR Default NEAREST_NEIGHBOUR

roif_func [str] the function used to compute the region of interest. Possible values: dist_beam, constant

roi [float] the (minimum) radius of the region of interest in m. Default half the largest resolution

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : dict

dictionary containing the gridded data

ind_rad : int radar index

pyrad.proc.process_aux.**process_point_measurement** (procstatus, dscfg, radar_list=None)

Obtains the radar data at a point measurement

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

lation [boolean. Dataset keyword] if True position is obtained from latitude, longitude information, otherwise position is obtained from antenna coordinates (range, azimuth, elevation).

truealt [boolean. Dataset keyword] if True the user input altitude is used to determine the point of interest. if False use the altitude at a given radar elevation ele over the point of interest.

lon [float. Dataset keyword] the longitude [deg]. Use when latlon is True.

lat [float. Dataset keyword] the latitude [deg]. Use when lation is True.

alt [float. Dataset keyword] altitude [m MSL]. Use when latlon is True.

ele [float. Dataset keyword] radar elevation [deg]. Use when latlon is False or when latlon is True and truealt is False

azi [float. Dataset keyword] radar azimuth [deg]. Use when latlon is False

```
AziTol [float. Dataset keyword] azimuthal tolerance to determine which radar azimuth
                      to use [deg]
                    EleTol [float. Dataset keyword] elevation tolerance to determine which radar elevation
                      to use [deg]
                   RngTol [float. Dataset keyword] range tolerance to determine which radar bin to use
                      [m]
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : dict
                   dictionary containing the data and metadata of the point of interest
               ind_rad: int
                    radar index
pyrad.proc.process_aux.process_qvp(procstatus, dscfg, radar_list=None)
      Computes quasi vertical profiles
           Parameters procstatus: int
                    Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration. Accepted Configuration Keywords:
                    datatype [string. Dataset keyword] The data type where we want to extract the point
                      measurement
                   anglenr [int] The sweep number to use. It assumes the radar volume consists on PPI
                   hmax [float] The maximum height to plot [m]. Default 10000.
                   hres [float] The height resolution [m]. Default 50
               radar_list: list of Radar objects
                    Optional. list of radar objects
           Returns new_dataset : dict
                   dictionary containing the QVP and a keyboard stating whether the processing has fin-
                    ished or not.
               ind rad: int
                    radar index
pyrad.proc.process_aux.process_raw(procstatus, dscfg, radar_list=None)
      dummy function that returns the initial input data set
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration
               radar list: list of Radar objects
```

rng [float. Dataset keyword] range from radar [m]. Use when latlon is False

```
Optional. list of radar objects
           Returns new_dataset : Radar
                    radar object
               ind_rad: int
                    radar index
pyrad.proc.process_aux.process_save_radar(procstatus, dscfg, radar_list=None)
      dummy function that allows to save the entire radar object
           Parameters procstatus: int
                    Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration
               radar_list : list of Radar objects
                    Optional. list of radar objects
           Returns new_dataset : Radar
                    radar object
               ind_rad: int
                   radar index
pyrad.proc.process_aux.process_time_height (procstatus, dscfg, radar_list=None)
      Produces time height radar objects at a point of interest defined by latitude and longitude
           Parameters procstatus: int
                    Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration. Accepted Configuration Keywords:
                    datatype [string. Dataset keyword] The data type where we want to extract the point
                      measurement
                   lat, lon [float] latitude and longitude of the point of interest [deg]
                   latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005
                   hmax [float] The maximum height to plot [m]. Default 10000.
                   hres [float] The height resolution [m]. Default 50
               radar_list : list of Radar objects
                    Optional. list of radar objects
           Returns new_dataset : dict
                    dictionary containing the QVP and a keyboard stating whether the processing has fin-
                    ished or not.
               ind_rad: int
                    radar index
```

CHAPTER

THREE

PYRAD.PROC.PROCESS_ECHOCLASS

Functions for echo classification and filtering

process_echo_id(procstatus, dscfg[, radar_list])	identifies echoes as 0: No data, 1: Noise, 2: Clutter,
process_echo_filter(procstatus, dscfg[,])	Masks all echo types that are not of the class specified in
process_cdf(procstatus, dscfg[, radar_list])	Collects the fields necessary to compute the Cumulative
	Distribution
<pre>process_filter_snr(procstatus, dscfg[,])</pre>	filters out low SNR echoes
<pre>process_filter_visibility(procstatus, dscfg)</pre>	filters out rays gates with low visibility and corrects the
	reflectivity
<pre>process_outlier_filter(procstatus, dscfg[,])</pre>	filters out gates which are outliers respect to the surround-
	ing
<pre>process_hydroclass(procstatus, dscfg[,])</pre>	Classifies precipitation echoes

pyrad.proc.process_echoclass.**process_cdf** (*procstatus*, *dscfg*, *radar_list=None*)

Collects the fields necessary to compute the Cumulative Distribution Function

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : Radar

radar object

radar inda

ind rad: int

radar index

pyrad.proc.process_echoclass.**process_echo_filter** (*procstatus*, *dscfg*, *radar_list=None*)

Masks all echo types that are not of the class specified in keyword echo_type

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

```
datatype [list of string. Dataset keyword] The input data types
                   echo_type [int] The type of echo to keep: 1 noise, 2 clutter, 3 precipitation. Default 3
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new dataset: Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_echoclass.process_echo_id (procstatus, dscfg, radar_list=None)
     identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_echoclass.process_filter_snr(procstatus, dscfg, radar_list=None)
     filters out low SNR echoes
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   SNRmin [float. Dataset keyword] The minimum SNR to keep the data.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_echoclass.process_filter_visibility(procstatus,
                                                                                                    dscfg,
                                                                              radar_list=None)
     filters out rays gates with low visibility and corrects the reflectivity
```

```
Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   VISmin [float. Dataset keyword] The minimum visibility to keep the data.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_echoclass.process_hydroclass(procstatus, dscfg, radar_list=None)
     Classifies precipitation echoes
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   HYDRO_METHOD [string.
                                                   Dataset keyword] The hydrometeor classification
                     method. One of the following: SEMISUPERVISED
                   RADARCENTROIDS [string. Datset keyword] Used with HYDRO_METHOD
                     SEMISUPERVISED. The name of the radar of which the derived centroids will be
                     used. One of the following: A Albis, L Lema, P Plaine Morte, DX50
               radar_list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_echoclass.process_outlier_filter(procstatus,
                                                                                                  dscfg,
                                                                        radar_list=None)
     filters out gates which are outliers respect to the surrounding
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
```

threshold [float. Dataset keyword] The distance between the value of the examined range gate and the median of the surrounding gates to consider the gate an outlier

nb [int. Dataset keyword] The number of neighbours (to one side) to analyse. i.e. 2 would correspond to 24 gates

nb_min [int. Dataset keyword] Minimum number of neighbouring gates to consider the examined gate valid

percentile_min, percentile_max [float. Dataset keyword] gates below (above) these
percentiles (computed over the sweep) are considered potential outliers and further
examined

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : Radar

radar object

ind_rad: int

radar index

PYRAD.PROC.PROCESS_PHASE

Functions for PhiDP and KDP processing and attenuation correction

corrects phidp of the system phase
corrects phidp of the system phase and smoothes it using
one window
corrects phidp of the system phase and smoothes it using
one window
Computes specific differential phase using a piecewise
least square method
Computes specific differential phase using a piecewise
least square method
Computes specific differential phase and differential phase
using the method developed by Vulpiani et al.
Computes specific differential phase and differential phase
using the Kalman filter as proposed by Schneebeli et al.
Estimates PhiDP and KDP using the method by Maesaka.
Estimates PhiDP and KDP using a linear programming al-
gorithm.
Computes specific attenuation and specific differential at-
tenuation using

pyrad.proc.process_phase.process_attenuation(procstatus, dscfg, radar_list=None)

Computes specific attenuation and specific differential attenuation using the Z-Phi method and corrects reflectivity and differential reflectivity

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

ATT_METHOD [float. Dataset keyword] The attenuation estimation method used. One of the following: ZPhi, Philin

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

```
radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_phase.process_correct_phidp0 (procstatus, dscfg, radar_list=None)
     corrects phidp of the system phase
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip
                     [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_phase.process_kdp_leastsquare_double_window(procstatus,
                                                                                         dscfg,
                                                                                          radar_list=None)
     Computes specific differential phase using a piecewise least square method
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rwinds [float. Dataset keyword] The length of the short segment for the least square
                      method [m]
                   rwindl [float. Dataset keyword] The length of the long segment for the least square
                      method [m]
```

```
Zthr [float. Dataset keyword] The threshold defining which estimated data to use
                     [dBZ]
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new dataset: Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_phase.process_kdp_leastsquare_single_window(procstatus,
                                                                                          radar_list=None)
     Computes specific differential phase using a piecewise least square method
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rwind [float. Dataset keyword] The length of the segment for the least square method
                     [m]
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_phase.process_phidp_kdp_Kalman(procstatus,
                                                                                                    dscfg,
                                                                       radar_list=None)
     Computes specific differential phase and differential phase using the Kalman filter as proposed by Schneebeli et
     al. The data is assumed to be clutter free and continous
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   parallel [boolean. Dataset keyword] if set use parallel computing
                   get_phidp [boolean. Datset keyword] if set the PhiDP computed by integrating the
                      resultant KDP is added to the radar field
               radar_list: list of Radar objects
                   Optional. list of radar objects
```

```
Returns new dataset: Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_phase.process_phidp_kdp_Maesaka (procstatus,
                                                                                                    dscfg,
                                                                         radar list=None)
     Estimates PhiDP and KDP using the method by Maesaka. This method only retrieves data in rain (i.e. below
     the melting layer)
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip
                     [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
                   fzl [float. Dataset keyword] The freezing level height [m]. Default 2000.
                   ml_thickness [float. Dataset keyword] The melting layer thickness in meters. Default
                     700.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_phase.process_phidp_kdp_Vulpiani(procstatus,
                                                                                                    dscfg,
                                                                          radar list=None)
     Computes specific differential phase and differential phase using the method developed by Vulpiani et al. The
     data is assumed to be clutter free and monotonous
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rwind [float. Dataset keyword] The length of the segment [m]
                   n_iter [int. Dataset keyword] number of iterations
```

```
bouring valid values
                   parallel [boolean. Dataset keyword] if set use parallel computing
                   get_phidp [boolean. Datset keyword] if set the PhiDP computed by integrating the
                     resultant KDP is added to the radar field
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_phase.process_phidp_kdp_lp(procstatus, dscfg, radar_list=None)
     Estimates PhiDP and KDP using a linear programming algorithm. This method only retrieves data in rain (i.e.
     below the melting layer)
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   fzl [float. Dataset keyword] The freezing level height [m]. Default 2000.
                   ml_thickness [float. Dataset keyword] The melting layer thickness in meters. Default
                      700.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process phase.process smooth phidp double window (procstatus,
                                                                                                    dscfg,
                                                                                     radar list=None)
     corrects phidp of the system phase and smoothes it using one window
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
```

interp [boolean. Dataset keyword] if set non valid values are interpolated using neigh-

```
rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip
                     [m]
                   rwinds [float. Dataset keyword] The length of the short smoothing window [m]
                   rwindl [float. Dataset keyword] The length of the long smoothing window [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
                   Zthr [float. Dataset keyword] The threshold defining wich smoothed data to used
                     [dBZ]
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_phase.process_smooth_phidp_single_window (procstatus,
                                                                                                    dscfg,
                                                                                     radar list=None)
     corrects phidp of the system phase and smoothes it using one window
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types

CHAPTER

FIVE

PYRAD.PROC.PROCESS_RETRIEVE

Functions for retrieving new moments and products

process_signal_power(procstatus, dscfg[,])	Computes the signal power in dBm
process_snr(procstatus, dscfg[, radar_list])	Computes SNR
process_1(procstatus, dscfg[, radar_list])	Computes L parameter
process_cdr(procstatus, dscfg[, radar_list])	Computes Circular Depolarization Ratio
<pre>process_rainrate(procstatus, dscfg[, radar_list])</pre>	Estimates rainfall rate from polarimetric moments
<pre>process_wind_vel(procstatus, dscfg[, radar_list])</pre>	Estimates the horizontal or vertical component of the wind
	from the
process_windshear(procstatus, dscfg[,])	Estimates the wind shear from the wind velocity

pyrad.proc.process_retrieve.**process_cdr**(procstatus, dscfg, radar_list=None)
Computes Circular Depolarization Ratio

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : Radar

radar object

 $ind_rad: int\\$

radar index

pyrad.proc.process_retrieve.process_1 (procstatus, dscfg, radar_list=None)
Computes L parameter

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

```
radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_retrieve.process_rainrate(procstatus, dscfg, radar_list=None)
     Estimates rainfall rate from polarimetric moments
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
                   RR METHOD [string. Dataset keyword] The rainfall rate estimation method. One of
                      the following: Z, ZPoly, KDP, A, ZKDP, ZA, hydro
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_retrieve.process_signal_power(procstatus, dscfg, radar_list=None)
     Computes the signal power in dBm
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   mflossv [float. Global keyword] The matching filter losses of the vertical channel.
                      Used if input is vertical reflectivity
                   radconstv [float. Global keyword] The vertical channel radar constant. Used if input
                      is vertical reflectivity
                   lrxv [float. Global keyword] The receiver losses from the antenna feed to the reference
                      point. [dB] positive value Used if input is vertical reflectivity
                   Iradomev [float. Global keyword] The 1-way dry radome losses [dB] positive value.
                      Used if input is vertical reflectivity
                   mflossh [float. Global keyword] The matching filter losses of the vertical channel.
                      Used if input is horizontal reflectivity
```

```
radconsth [float. Global keyword] The horizontal channel radar constant. Used if
                      input is horizontal reflectivity
                   lrxh [float. Global keyword] The receiver losses from the antenna feed to the reference
                      point. [dB] positive value Used if input is horizontal reflectivity
                   Iradomeh [float. Global keyword] The 1-way dry radome losses [dB] positive value.
                      Used if input is horizontal reflectivity
                    attg [float. Dataset keyword] The gas attenuation
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                    radar object
               ind_rad: int
                    radar index
pyrad.proc.process_retrieve.process_snr (procstatus, dscfg, radar_list=None)
      Computes SNR
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
                    output_type [string. Dataset keyword] The output data type. Either SNRh or SNRv
               radar_list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                    radar object
               ind rad: int
                   radar index
pyrad.proc.process_retrieve.process_wind_vel (procstatus, dscfg, radar_list=None)
      Estimates the horizontal or vertical component of the wind from the radial velocity
           Parameters procstatus: int
                    Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                    data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
                    vert_proj [Boolean] If true the vertical projection is computed. Otherwise the horizon-
                      tal projection is computed
               radar_list : list of Radar objects
                    Optional. list of radar objects
```

```
Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_retrieve.process_windshear(procstatus, dscfg, radar_list=None)
      Estimates the wind shear from the wind velocity
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The input data type
                   az_tol [float] The tolerance in azimuth when looking for gates on top of the gate when
                     computation is performed
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
```

PYRAD.PROC.PROCESS_CALIB

Functions for monitoring data quality and correct bias and noise effects

process_correct_bias(procstatus, dscfg[,])	Corrects a bias on the data
process_correct_noise_rhohv(procstatus,	identifies echoes as 0: No data, 1: Noise, 2: Clutter,
dscfg)	,
process_selfconsistency_kdp_phidp([,])	Computes specific differential phase and differential phase
	in rain using
process_selfconsistency_bias(procstatus,	Estimates the reflectivity bias by means of the selfconsis-
dscfg)	tency
process_estimate_phidp0(procstatus, dscfg[,])	estimates the system differential phase offset at each ray
process_rhohv_rain(procstatus, dscfg[,])	Keeps only suitable data to evaluate the 80 percentile of
	RhoHV in rain
process_zdr_precip(procstatus, dscfg[,])	Keeps only suitable data to evaluate the differential reflec-
	tivity in
process_zdr_snow(procstatus, dscfg[, radar_list])	Keeps only suitable data to evaluate the differential reflec-
	tivity in
<pre>process_monitoring(procstatus, dscfg[,])</pre>	computes monitoring statistics
<pre>process_time_avg(procstatus, dscfg[, radar_list])</pre>	computes the temporal mean of a field
<pre>process_weighted_time_avg(procstatus, dscfg)</pre>	computes the temporal mean of a field weighted by the re-
	flectivity
process_time_avg_flag(procstatus, dscfg[,])	computes a flag field describing the conditions of the data
	used while
<pre>process_colocated_gates(procstatus, dscfg[,])</pre>	Find colocated gates within two radars
<pre>process_intercomp(procstatus, dscfg[,])</pre>	intercomparison between two radars
<pre>process_intercomp_time_avg(procstatus, dscfg)</pre>	intercomparison between the average reflectivity of two
	radars
<pre>process_sun_hits(procstatus, dscfg[, radar_list])</pre>	monitoring of the radar using sun hits

pyrad.proc.process_calib.process_colocated_gates (procstatus, dscfg, radar_list=None)
 Find colocated gates within two radars

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

h_tol [float. Dataset keyword] Tolerance in altitude difference between radar gates [m]. Default 100.

```
tween radar gates [deg]. Default 0.0005
                   vol_d_tol [float. Dataset keyword] Tolerance in pulse volume diameter [m]. Default
                      100.
                   vismin [float. Dataset keyword] Minimum visibility [percent]. Default None.
                   hmin [float. Dataset keyword] Minimum altitude [m MSL]. Default None.
                   hmax [float. Dataset keyword] Maximum altitude [m MSL]. Default None.
                   rmin [float. Dataset keyword] Minimum range [m]. Default None.
                   rmax [float. Dataset keyword] Maximum range [m]. Default None.
                   elmin [float. Dataset keyword] Minimum elevation angle [deg]. Default None.
                   elmax [float. Dataset keyword] Maximum elevation angle [deg]. Default None.
                   azrad1min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 1. De-
                      fault None.
                   azrad1max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 1. De-
                      fault None.
                   azrad2min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 2. De-
                      fault None.
                   azrad2max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 2. De-
                      fault None.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : radar object
                   radar object containing the flag field
               ind_rad: int
                   radar index
pyrad.proc.process_calib.process_correct_bias (procstatus, dscfg, radar_list=None)
     Corrects a bias on the data
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [string. Dataset keyword] The data type to correct for bias
                   bias [float. Dataset keyword] The bias to be corrected [dB]. Default 0
               radar_list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
```

latlon_tol [float. Dataset keyword] Tolerance in latitude and longitude position be-

```
radar index
pyrad.proc.process_calib.process_correct_noise_rhohv (procstatus,
                                                                                                   dscfg,
                                                                           radar list=None)
     identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The data types used in the correction
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_calib.process_estimate_phidp0 (procstatus, dscfg, radar_list=None)
     estimates the system differential phase offset at each ray
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] The minimum range where to look for valid data [m]
                   rmax [float. Dataset keyword] The maximum range where to look for valid data [m]
                   rcell [float. Dataset keyword] The length of a continuous cell to consider it valid precip
                     [m]
                   Zmin [float. Dataset keyword] The minimum reflectivity [dBZ]
                   Zmax [float. Dataset keyword] The maximum reflectivity [dBZ]
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new dataset: Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_intercomp (procstatus, dscfg, radar_list=None)
     intercomparison between two radars
           Parameters procstatus: int
```

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

coloc_data_dir [string. Dataset keyword] name of the directory containing the csv file with colocated data

coloc_radars_name [string. Dataset keyword] string identifying the radar names

azi_tol [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg

ele_tol [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5 deg

rng_tol [float. Dataset keyword] range tolerance between the two radars. Default 50 m

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : dict

dictionary containing a dictionary with intercomparison data and the key "final" which contains a boolean that is true when all volumes have been processed

ind_rad: int

radar index

pyrad.proc.process_calib.process_intercomp_time_avg(procstatus, radar_list=None)

intercomparison between the average reflectivity of two radars

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

coloc_data_dir [string. Dataset keyword] name of the directory containing the csv file
with colocated data

coloc radars name [string. Dataset keyword] string identifying the radar names

azi_tol [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg

ele_tol [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5 deg

rng_tol [float. Dataset keyword] range tolerance between the two radars. Default 50 m

clt_max [int. Dataset keyword] maximum number of samples that can be clutter contaminated. Default 100 i.e. all

phi_excess_max [int. Dataset keyword] maximum number of samples that can have excess instantaneous PhiDP. Default 100 i.e. all

non_rain_max [int. Dataset keyword] maximum number of samples that can be no rain. Default 100 i.e. all

```
phi_avg_max [float. Dataset keyword] maximum average PhiDP allowed. Default 600
                     deg i.e. any
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new dataset: dict
                   dictionary containing a dictionary with intercomparison data and the key "final" which
                   contains a boolean that is true when all volumes have been processed
               ind_rad: int
                   radar index
pyrad.proc.process_calib.process_monitoring(procstatus, dscfg, radar_list=None)
     computes monitoring statistics
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   step [float. Dataset keyword] The width of the histogram bin. Default is None. In that
                     case the default step in function get histogram bins is used
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object containing histogram data
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_rhohv_rain(procstatus, dscfg, radar_list=None)
     Keeps only suitable data to evaluate the 80 percentile of RhoHV in rain
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default
                      1000.
                   rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default
                      50000.
                   Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation
                      [dBZ]. Default 20.
                   Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipita-
                      tion [dBZ] Default 40.
```

```
700.
                   fzl [float. Dataset keyword] The default freezing level height. It will be used if no
                      temperature field name is specified or the temperature field is not in the radar object.
                     Default 2000.
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_selfconsistency_bias (procstatus,
                                                                                                    dscfg,
                                                                             radar_list=None)
     Estimates the reflectivity bias by means of the selfconsistency algorithm by Gourley
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   fzl [float. Dataset keyword] Default freezing level height. Default 2000.
                   rsmooth [float. Dataset keyword] length of the smoothing window [m]. Default 1000.
                   min_rhohv [float. Dataset keyword] minimum valid RhoHV. Default 0.92
                   max_phidp [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.
                   ml_thickness [float. Dataset keyword] Melting layer thickness [m]. Default 700.
                   rcell [float. Dataset keyword] length of continuous precipitation to consider the precip-
                      itation cell a valid phidp segment [m]. Default 1000.
                   dphidp_min [float. Dataset keyword] minimum phase shift [deg]. Default 2.
                   dphidp_max [float. Dataset keyword] maximum phase shift [deg]. Default 16.
               radar_list : list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_calib.process_selfconsistency_kdp_phidp (procstatus,
                                                                                                    dscfg,
                                                                                    radar_list=None)
     Computes specific differential phase and differential phase in rain using the selfconsistency between Zdr, Zh
     and KDP
           Parameters procstatus: int
```

ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of strings. Dataset keyword] The input data types

rsmooth [float. Dataset keyword] length of the smoothing window [m]. Default 1000.

min rhohy [float. Dataset keyword] minimum valid RhoHV. Default 0.92

max_phidp [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.

ml_thickness [float. Dataset keyword] assumed melting layer thickness [m]. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : Radar

radar object

ind rad: int

radar index

pyrad.proc.process_calib.process_sun_hits (procstatus, dscfg, radar_list=None)
 monitoring of the radar using sun hits

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for a sun hit signal [m]. Default 20

delev_max [float. Dataset keyword] maximum elevation distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5

dazim_max [float. Dataset keyword] maximum azimuth distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5

elmin [float. Dataset keyword] minimum radar elevation where to look for sun hits [deg]. Default 1.

percent_bins [float. Dataset keyword.] minimum percentage of range bins that have to contain signal to consider the ray a potential sun hit. Default 10.

attg [float. Dataset keyword] gaseous attenuation. Default None

max_std [float. Dataset keyword] maximum standard deviation to consider the data noise. Default 1.

az_width_co [float. Dataset keyword] co-polar antenna azimuth width (convoluted with sun width) [deg]. Default None

```
with sun width) [deg]. Default None
                   az_width_cross [float. Dataset keyword] cross-polar antenna azimuth width (convo-
                      luted with sun width) [deg]. Default None
                   el width cross [float. Dataset keyword] cross-polar antenna elevation width (convo-
                      luted with sun width) [deg]. Default None
                   ndays [int. Dataset keyword] number of days used in sun retrieval. Default 1
                   coeff_band [float. Dataset keyword] multiplicate coefficient to transform pulse width
                      into receiver bandwidth
               radar_list: list of Radar objects
                   Optional. list of radar objects
           Returns sun_hits_dict : dict
                   dictionary containing a radar object, a sun_hits dict and a sun_retrieval dictionary
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_time_avg(procstatus, dscfg, radar_list=None)
     computes the temporal mean of a field
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   period [float. Dataset keyword] the period to average [s]. Default 3600.
                   start_average [float. Dataset keyword] when to start the average [s from midnight
                      UTC]. Default 0.
                   lin trans: int. Dataset keyword If 1 apply linear transformation before averaging
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_time_avg_flag(procstatus, dscfg, radar_list=None)
     computes a flag field describing the conditions of the data used while averaging
           Parameters procstatus: int
                    Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
```

el_width_co [float. Dataset keyword] co-polar antenna elevation width (convoluted

```
datatype [list of string. Dataset keyword] The input data types
                   period [float. Dataset keyword] the period to average [s]. Default 3600.
                   start_average [float. Dataset keyword] when to start the average [s from midnight
                      UTC]. Default 0.
                   phidpmax: float. Dataset keyword maximum PhiDP
               radar list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind_rad: int
                   radar index
pyrad.proc.process_calib.process_weighted_time_avg(procstatus,
                                                                                                    dscfg,
                                                                         radar list=None)
     computes the temporal mean of a field weighted by the reflectivity
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   period [float. Dataset keyword] the period to average [s]. Default 3600.
                   start_average [float. Dataset keyword] when to start the average [s from midnight
                     UTC]. Default 0.
               radar_list: list of Radar objects
                   Optional. list of radar objects
           Returns new_dataset : Radar
                   radar object
               ind rad: int
                   radar index
pyrad.proc.process_calib.process_zdr_precip(procstatus, dscfg, radar_list=None)
     Keeps only suitable data to evaluate the differential reflectivity in moderate rain or precipitation (for vertical
     scans)
           Parameters procstatus: int
                   Processing status: 0 initializing, 1 processing volume, 2 post-processing
               dscfg: dictionary of dictionaries
                   data set configuration. Accepted Configuration Keywords:
                   datatype [list of string. Dataset keyword] The input data types
                   ml_filter [boolean. Dataset keyword] indicates if a filter on data in and above the
                      melting layer is applied. Default True.
```

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation [dBZ]. Default 20.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipitation [dBZ] Default 22.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as precipitation Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as precipitation [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for precipitation [deg] Default None.

ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset: Radar

radar object

ind_rad: int

radar index

pyrad.proc.process_calib.**process_zdr_snow** (procstatus, dscfg, radar_list=None)
Keeps only suitable data to evaluate the differential reflectivity in snow

Parameters procstatus: int

Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg: dictionary of dictionaries

data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as snow [dBZ]. Default 0.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as snow [dBZ] Default 30.

SNRmin [float. Dataset keyword] minimum SNR to consider the bin as snow [dB]. Default 10.

SNRmax [float. Dataset keyword] maximum SNR to consider the bin as snow [dB] Default 50.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as snow Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as snow [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for snow [deg] Default None.

KDPmax [float. Dataset keyword] maximum KDP to consider the bin as snow [deg] Default None

TEMPmin [float. Dataset keyword] minimum temperature to consider the bin as snow [deg C]. Default None

TEMPmax [float. Dataset keyword] maximum temperature to consider the bin as snow [deg C] Default None

hydroclass [list of ints. Dataset keyword] list of hydrometeor classes to keep for the analysis Default [1] (dry snow)

radar_list : list of Radar objects

Optional. list of radar objects

Returns new_dataset : Radar

radar object

ind_rad: int

radar index

pyrad library reference for developers, Release 0.0.1	

CHAPTER

SEVEN

PYRAD.PROD.PRODUCT_AUX

Auxiliary functions to generate products

get_prodgen_func(dsformat, dsname, dstype)

maps the dataset format into its processing function

pyrad.prod.product_aux.get_prodgen_func (dsformat, dsname, dstype)
 maps the dataset format into its processing function

Parameters dsformat: str

dataset group, i.e. 'VOL', etc.

Returns func: function

pyrad function used to generate the products

pyrad library reference for developers, Release 0.0.1		
	Observace 7	

CHAPTER

EIGHT

PYRAD.PROD.PROCESS_PRODUCT

Functions for obtaining Pyrad products from the datasets

<pre>generate_cosmo_coord_products(dataset, prd- cfg)</pre>	generates COSMO coordinates products
generate_sun_hits_products(dataset, prdcfg)	generates sun hits products
<pre>generate_intercomp_products(dataset, prdcfg)</pre>	generates radar intercomparison products
<pre>generate_colocated_gates_products(dataset,</pre>	generates colocated gates products
)	
<pre>generate_time_avg_products(dataset, prdcfg)</pre>	generates time average products
<pre>generate_qvp_products(dataset, prdcfg)</pre>	generates QVP products
<pre>generate_vol_products(dataset, prdcfg)</pre>	generates radar volume products
<pre>generate_timeseries_products(dataset, prdcfg)</pre>	generates time series products
<pre>generate_monitoring_products(dataset, prdcfg)</pre>	generates a monitoring product
<pre>generate_grid_products(dataset, prdcfg)</pre>	generates grid products

pyrad.prod.process_product.generate_colocated_gates_products (dataset, prdcfg)
generates colocated gates products

Parameters dataset: tuple

radar objects and colocated gates dictionary

prdcfg : dictionary of dictionaries

product configuration dictionary of dictionaries

Returns filename: str

the name of the file created. None otherwise

pyrad.prod.process_product.generate_cosmo_coord_products (dataset, prdcfg)
 generates COSMO coordinates products

Parameters dataset: tuple

radar object and sun hits dictionary

prdcfg: dictionary of dictionaries

product configuration dictionary of dictionaries

Returns filename: str

the name of the file created. None otherwise

 $\label{eq:products} \texttt{pyrad.products}. \\ \texttt{products}. \\ \textbf{generate_grid_products} \ (\textit{dataset}, \textit{prdcfg}) \\ \\ \textbf{generates grid products}$

```
Parameters dataset : grid
                   grid object
               prdcfg: dictionary of dictionaries
                   product configuration dictionary of dictionaries
          Returns no return
pyrad.prod.process_product.generate_intercomp_products(dataset, prdcfg)
     generates radar intercomparison products
          Parameters dataset: tuple
                   values of colocated gates dictionary
               prdcfg: dictionary of dictionaries
                   product configuration dictionary of dictionaries
          Returns filename: str
                   the name of the file created. None otherwise
pyrad.prod.process_product.generate_monitoring_products(dataset, prdcfg)
     generates a monitoring product
          Parameters dataset: dictionary
                   dictionary containing a histogram object and some metadata
               prdcfg: dictionary of dictionaries
                   product configuration dictionary of dictionaries
          Returns filename: str
                   the name of the file created. None otherwise
pyrad.prod.process_product.generate_qvp_products(dataset, prdcfg)
     generates QVP products
          Parameters dataset: dict
                  dictionary containing the radar object and a keyword stating the status of the processing
               prdcfg: dictionary of dictionaries
                   product configuration dictionary of dictionaries
          Returns filename: str
                   the name of the file created. None otherwise
pyrad.prod.process_product.generate_sun_hits_products(dataset, prdcfg)
     generates sun hits products
          Parameters dataset: tuple
                  radar object and sun hits dictionary
               prdcfg: dictionary of dictionaries
                   product configuration dictionary of dictionaries
          Returns filename: str
                   the name of the file created. None otherwise
```

```
pyrad.prod.process_product.generate_time_avg_products(dataset, prdcfg)
     generates time average products
          Parameters dataset: tuple
                  radar objects and colocated gates dictionary
              prdcfg: dictionary of dictionaries
                  product configuration dictionary of dictionaries
          Returns filename: str
                  the name of the file created. None otherwise
pyrad.prod.process_product.generate_timeseries_products(dataset, prdcfg)
     generates time series products
          Parameters dataset: dictionary
                  radar object
              prdcfg: dictionary of dictionaries
                  product configuration dictionary of dictionaries
          Returns no return
pyrad.prod.process_product.generate_vol_products(dataset, prdcfg)
     generates radar volume products
          Parameters dataset: Radar
                  radar object
              prdcfg: dictionary of dictionaries
                  product configuration dictionary of dictionaries
          Returns no return
```

pyrad library reference for developers,	Release 0.0.1

PYRAD.IO.READ_DATA_RADAR

Functions for reading radar data files

Reads pyrad input data.
merge rainbow scans
merge rainbow scans
merge rad4alp data.
merge rainbow scans
merge cosmo rad4alp scans. If data for all the scans cannot
be retrieved
merge cosmo rad4alp scans. If data for all the scans cannot
be retrieved
merge rad4alp hydrometeor classification scans. If data for
all the scans
merge Rainbow fields into a single radar object.
merge CF/Radial fields into a single radar object.
merge DEM fields into a single radar object.
merge COSMO fields in Rainbow file format
gets rainbow radar data
gets rad4alp radar data
adds the fields from orig radar into dest radar. If they are
not in the
interpolates field field_name contained in radar_orig to the
grid in

pyrad.io.read_data_radar.add_field(radar_dest, radar_orig)

adds the fields from orig radar into dest radar. If they are not in the same grid, interpolates them to dest grid

Parameters radar_dest : radar object

the destination radar

radar_orig: radar object

the radar object containing the original field

Returns field_dest : dict

interpolated field and metadata

pyrad.io.read_data_radar.get_data(voltime, datatypesdescr, cfg)

Reads pyrad input data.

Parameters voltime: datetime object

```
volume scan time
               datatypesdescr : list
                   list of radar field types to read. Format : [radar file type]:[datatype]
               cfg: dictionary of dictionaries
                   configuration info to figure out where the data is
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.get_data_mxpol (filename,
                                                                      datatype_list,
                                                                                       scan_name,
                                                                                                       cfg,
                                                         ind rad=0
     gets MXPol radar data
           Parameters filename: str
                   name of file containing MXPol data
               datatype_list: list of strings
                   list of data fields to get
               scan_name: list
                   list of scans, in the case of mxpol, the elevation or azimuth denoted as 005 or 090 (for 5
                   or 90 degrees elevation) or 330 (for 330 degrees azimuth respectively)
               cfg: dict
                   configuration dictionary
               ind_rad: int
                   radar index
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.get_data_rad4alp (filename,
                                                                        datatype_list,
                                                                                        scan_name,
                                                                                                       cfg,
                                                            ind_rad=0)
     gets rad4alp radar data
           Parameters filename: str
                   name of file containing rainbow data
               datatype_list: list of strings
                   list of data fields to get
               scan name: str
                   name of the elevation (001 to 020)
               cfg: dict
                   configuration dictionary
               ind_rad: int
                   radar index
           Returns radar: Radar
                   radar object
```

```
pyrad.io.read_data_radar.get_data_rainbow (filename, datatype)
     gets rainbow radar data
           Parameters filename: str
                   name of file containing rainbow data
               datatype: str
                   field name
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.interpol_field(radar_dest,
                                                                                             field name,
                                                                          radar orig.
                                                        fill_value=None)
     interpolates field field_name contained in radar_orig to the grid in radar_dest
           Parameters radar_dest : radar object
                   the destination radar
               radar_orig: radar object
                   the radar object containing the original field
               field name: str
                   name of the field to interpolate
           Returns field_dest: dict
                   interpolated field and metadata
pyrad.io.read_data_radar.merge_fields_cfradial(basepath,
                                                                                                voltime.
                                                                                loadname.
                                                                  datatype_list, dataset_list, product_list)
     merge CF/Radial fields into a single radar object.
           Parameters basepath: str
                   name of the base path where to find the data
               loadname: str
                   name of the saving directory
               voltime: datetime object
                   reference time of the scan
               datatype_list : list
                   list of data types to get
               dataset list: list
                   list of datasets that produced the data type to get. Used to get path.
               product_list : list
                   list of products. Used to get path
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_fields_cosmo (filename_list)
     merge COSMO fields in Rainbow file format
```

```
Parameters filename list: str
                   list of file paths where to find the data
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_fields_dem(basepath, scan_name, datatype_list)
     merge DEM fields into a single radar object.
           Parameters basepath: str
                   name of the base path where to find the data
               scan name: str
                   name of the scan
               datatype_list : list
                   lists of data types to get
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_fields_rainbow(basepath,
                                                                                                voltime,
                                                                               scan_name,
                                                                datatype_list)
     merge Rainbow fields into a single radar object.
           Parameters basepath: str
                   name of the base path where to find the data
               scan_name: str
                   name of the scan
               voltime: datetime object
                   reference time of the scan
               datatype_list : list
                   lists of data types to get
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_scans_cosmo (voltime, datatype_list, cfg, ind_rad=0)
     merge rainbow scans
           Parameters voltime: datetime object
                   reference time of the scan
               datatype_list : list
                   lists of data types to get
               cfg: dict
                   configuration dictionary
               ind_rad: int
                   radar index
           Returns radar: Radar
```

```
radar object
pyrad.io.read_data_radar.merge_scans_cosmo_rad4alp(voltime,
                                                                                    datatype,
                                                                                                   cfg,
                                                                      ind rad=0
     merge cosmo rad4alp scans. If data for all the scans cannot be retrieved returns None
          Parameters voltime: datetime object
                   reference time of the scan
               datatype: str
                   name of the data type to read
               cfg: dict
                  configuration dictionary
               ind_rad: int
                   radar index
          Returns radar: Radar
                  radar object
pyrad.io.read_data_radar.merge_scans_dem(basepath,
                                                                         scan list,
                                                                                          datatype_list,
                                                        radarnr='RADAR001')
     merge rainbow scans
          Parameters basepath: str
                  base path of rad4alp radar data
               scan_list: list
                   list of scans
               datatype_list: list
                   lists of data types to get
               radarnr: str
                  radar identifier number
          Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_scans_dem_rad4alp(voltime, datatype, cfg, ind_rad=0)
     merge cosmo rad4alp scans. If data for all the scans cannot be retrieved returns None
          Parameters voltime: datetime object
                   reference time of the scan
               datatype: str
                   name of the data type to read
               cfg: dict
                   configuration dictionary
               ind rad: int
                  radar index
```

Returns radar: Radar

```
radar object
pyrad.io.read_data_radar.merge_scans_hydro_rad4alp(voltime,
                                                                                     datatype,
                                                                                                    cfg,
                                                                       ind rad=0
     merge rad4alp hydrometeor classification scans. If data for all the scans cannot be retrieved returns None
           Parameters voltime: datetime object
                   reference time of the scan
               datatype: str
                   name of the data type to read
               cfg: dict
                   configuration dictionary
               ind rad: int
                   radar index
           Returns radar: Radar
                   radar object
pyrad.io.read_data_radar.merge_scans_mxpol (basepath, scan_list, voltime, datatype_list, cfg,
                                                            ind rad=0
     merge rad4alp data.
           Parameters basepath: str
                   base path of mxpol radar data
               scan_list : list
                   list of scans, in the case of mxpol, the elevation or azimuth denoted as 005 or 090 (for 5
                   or 90 degrees elevation) or 330 (for 330 degrees azimuth respectively)
               voltime: datetime object
                   reference time of the scan
               datatype_list : list
                   lists of data types to get
               cfg: dict
                   configuration dictionary
               ind_rad: int
                   radar index
           Returns radar: Radar
                   radar object
pyrad.io.read data radar.merge scans rad4alp(basepath,
                                                                             scan list,
                                                                                            radar name,
                                                               radar_res, voltime, datatype_list, cfg,
                                                               ind_rad=0)
     merge rad4alp data.
           Parameters basepath : str
                   base path of rad4alp radar data
               scan\_list: list
```

```
list of scans (001 to 020)
                radar_name : str
                    radar_name (A, D, L, ...)
                radar_res : str
                    radar resolution (H or L)
                voltime: datetime object
                    reference time of the scan
               datatype_list : list
                    lists of data types to get
               cfg: dict
                    configuration dictionary
               ind_rad: int
                    radar index
           Returns radar: Radar
                    radar object
pyrad.io.read_data_radar.merge_scans_rainbow (basepath, scan_list, voltime, scan_period,
                                                                 datatype_list, cfg, radarnr='RADAR001')
      merge rainbow scans
           Parameters basepath: str
                    base path of rad4alp radar data
                scan_list : list
                    list of scans
                voltime: datetime object
                    reference time of the scan
                scan_period : float
                    time from reference time where to look for other scans data
               datatype_list: list
                    lists of data types to get
                cfg: dict
                    configuration dictionary
                radarnr : str
                    radar identifier number
           Returns radar: Radar
                    radar object
```

pyrad library reference for developers, Release 0.0.1	

PYRAD.IO.READ_DATA_OTHER

Functions for reading auxiliary data

read_last_state(fname)	Reads a file containing the date of acquisition of the last
	volume
read_status(voltime, cfg[, ind_rad])	Reads rad4alp xml status file.
read_rad4alp_cosmo(fname, datatype)	Reads rad4alp COSMO data binary file.
read_rad4alp_vis(fname, datatype)	Reads rad4alp visibility data binary file.
read_colocated_gates(fname)	Reads a csv files containing the posistion of colocated gates
read_colocated_data(fname)	Reads a csv files containing colocated data
read_colocated_data_time_avg(fname)	Reads a csv files containing time averaged colocated data
read_timeseries(fname)	Reads a time series contained in a csv file
<pre>read_lightning(fname[, filter_data])</pre>	Reads lightning data contained in a text file.
read_ts_cum(fname)	Reads a time series of precipitation accumulation contained
	in a csv file
read_monitoring_ts(fname)	Reads a monitoring time series contained in a csv file
read_intercomp_scores_ts(fname)	Reads a radar intercomparison scores csv file
read_sun_hits_multiple_days(cfg, time_ref[,	Reads sun hits data from multiple file sources
])	
read_sun_hits(fname)	Reads sun hits data contained in a csv file
read_sun_retrieval(fname)	Reads sun retrieval data contained in a csv file
read_solar_flux(fname)	Reads solar flux data from the DRAO observatory in
	Canada
get_sensor_data(date, datatype, cfg)	Gets data from a point measurement sensor (rain gauge or
	disdrometer)
read_smn(fname)	Reads SwissMetNet data contained in a csv file
read_smn2(fname)	Reads SwissMetNet data contained in a csv file with format
read_disdro_scattering(fname)	Reads scattering parameters computed from disdrometer
	data contained in a
read_selfconsistency(fname)	Reads a self-consistency table with Zdr, Kdp/Zh columns
read_antenna_pattern(fname[, linear, twoway])	Read antenna pattern from file

pyrad.io.read_data_other.get_sensor_data (date, datatype, cfg)
Gets data from a point measurement sensor (rain gauge or disdrometer)

Parameters date: datetime object

measurement date

datatype : str

name of the data type to read

```
cfg: dictionary
                  dictionary containing sensor information
          Returns sensordate, sensorvalue, label, period: tupple
                  date, value, type of sensor and measurement period
pyrad.io.read data other.read antenna pattern(fname, linear=False, twoway=False)
     Read antenna pattern from file
          Parameters fname: str
                  path of the antenna pattern file
              linear: boolean
                  if true the antenna pattern is given in linear units
              twoway: boolean
                  if true the attenuation is two-way
          Returns pattern: dict
                  dictionary with the fields angle and attenuation
pyrad.io.read_data_other.read_colocated_data(fname)
     Reads a csv files containing colocated data
          Parameters fname: str
                  path of time series file
          Returns rad1_ele, rad1_azi, rad1_rng, rad1_val, rad2_ele, rad2_azi, rad2_rng,
              rad2_val: tupple
                  A tupple with the data read. None otherwise
pyrad.io.read_data_other.read_colocated_data_time_avg(fname)
     Reads a csv files containing time averaged colocated data
          Parameters fname: str
                  path of time series file
          Returns rad1_ele, rad1_azi, rad1_rng, rad1_val, rad2_ele, rad2_azi, rad2_rng,
              rad2_val: tupple
                  A tupple with the data read. None otherwise
pyrad.io.read_data_other.read_colocated_gates (fname)
     Reads a csv files containing the posistion of colocated gates
          Parameters fname: str
                  path of time series file
          Returns rad1_ele, rad1_azi, rad1_rng, rad2_ele, rad2_azi, rad2_rng: tupple
                  A tupple with the data read. None otherwise
pyrad.io.read_data_other.read_disdro_scattering(fname)
     Reads scattering parameters computed from disdrometer data contained in a text file
          Parameters fname: str
                  path of time series file
```

```
Returns date, preciptype, lwc, rr, zh, zv, zdr, ldr, ah, av, adiff, kdp, deltaco,
               rhohv: tupple
                   The read values
pyrad.io.read_data_other.read_intercomp_scores_ts(fname)
     Reads a radar intercomparison scores csv file
          Parameters fname: str
                   path of time series file
          Returns date_vec, np_vec, meanbias_vec, medianbias_vec, modebias_vec, corr_vec,
               slope_vec, intercep_vec, intercep_slope1_vec : tupple
                   The read data. None otherwise
pyrad.io.read_data_other.read_last_state(fname)
     Reads a file containing the date of acquisition of the last volume processed
          Parameters fname: str
                   name of the file to read
          Returns last_state : datetime object
                   the date
pyrad.io.read_data_other.read_lightning(fname, filter_data=True)
     Reads lightning data contained in a text file. The file has the following fields:
          flashnr: (0 is for noise) UTC seconds of the day Time within flash (in seconds) Latitude (decimal
          degrees) Longitude (decimal degrees) Altitude (m MSL) Power (dBm)
          Parameters fname: str
                   path of time series file
               filter_data: Boolean
                   if True filter noise (flashnr = 0)
          Returns flashnr, time, time in flash, lat, lon, alt, dBm: tupple
                   A tupple containing the read values. None otherwise
pyrad.io.read_data_other.read_monitoring_ts (fname)
     Reads a monitoring time series contained in a csv file
          Parameters fname: str
                  path of time series file
          Returns date, np_t, central_quantile, low_quantile, high_quantile: tupple
                   The read data. None otherwise
pyrad.io.read_data_other.read_rad4alp_cosmo(fname, datatype)
     Reads rad4alp COSMO data binary file.
          Parameters fname: str
                   name of the file to read
               datatype: str
```

```
name of the data type
          Returns field: dictionary
                  The data field
pyrad.io.read_data_other.read_rad4alp_vis(fname, datatype)
     Reads rad4alp visibility data binary file.
          Parameters fname: str
                  name of the file to read
              datatype: str
                  name of the data type
          Returns field_list: list of dictionaries
                  A data field. Each element of the list corresponds to one elevation
pyrad.io.read_data_other.read_selfconsistency(fname)
     Reads a self-consistency table with Zdr, Kdp/Zh columns
          Parameters fname: str
                  path of time series file
          Returns zdr, kdpzh : arrays
                  The read values
pyrad.io.read data other.read smn (fname)
     Reads SwissMetNet data contained in a csv file
          Parameters fname: str
                  path of time series file
          Returns id, date, pressure, temp, rh, precip, wspeed, wdir: tupple
                  The read values
pyrad.io.read_data_other.read_smn2 (fname)
     Reads SwissMetNet data contained in a csv file with format station,time,value
          Parameters fname: str
                  path of time series file
          Returns id, date, value: tupple
                  The read values
pyrad.io.read_data_other.read_solar_flux (fname)
     Reads solar flux data from the DRAO observatory in Canada
          Parameters fname: str
                  path of time series file
          Returns flux_datetime: datetime array
                  the date and time of the solar flux retrievals
              flux_value: array
                  the observed solar flux
```

```
pyrad.io.read_data_other.read_status(voltime, cfg, ind_rad=0)
     Reads rad4alp xml status file.
           Parameters voltime: datetime object
                   volume scan time
               cfg: dictionary of dictionaries
                   configuration info to figure out where the data is
               ind rad: int
                   radar index
           Returns root: root element object
                   The information contained in the status file
pyrad.io.read_data_other.read_sun_hits(fname)
     Reads sun hits data contained in a csv file
           Parameters fname: str
                   path of time series file
           Returns date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,
               pv, pv_std, npv, nvalv, zdr, zdr_std, nzdr, nvalzdr : tupple
                   Each parameter is an array containing a time series of information on a variable
pyrad.io.read_data_other.read_sun_hits_multiple_days (cfg, time_ref, nfiles=1)
     Reads sun hits data from multiple file sources
           Parameters cfg: dict
                   dictionary with configuration data to find out the right file
               time ref: datetime object
                   reference time
               nfiles: int
                   number of files to read
           Returns date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,
               pv, pv_std, npv, nvalv, zdr, zdr_std, nzdr, nvalzdr : tupple
                   Each parameter is an array containing a time series of information on a variable
pyrad.io.read data other.read sun retrieval (fname)
     Reads sun retrieval data contained in a csv file
           Parameters fname: str
                   path of time series file
           Returns first_hit_time, last_hit_time, nhits_h, el_width_h, az_width_h, el_bias_h,
               az_bias_h, dBm_sun_est, std_dBm_sun_est, nhits_v, el_width_v, az_width_v,
               el_bias_v, az_bias_v, dBmv_sun_est, std_dBmv_sun_est, nhits_zdr,
               zdr_sun_est, std_zdr_sun_est, dBm_sun_ref, ref_time : tupple
                   Each parameter is an array containing a time series of information on a variable
```

pyrad.io.read_data_other.read_timeseries (fname)

Reads a time series contained in a csv file

Parameters fname: str

path of time series file

Returns date, value: tupple

A datetime object array containing the time and a numpy masked array containing the value. None otherwise

pyrad.io.read_data_other.read_ts_cum(fname)

Reads a time series of precipitation accumulation contained in a csv file

Parameters fname: str

path of time series file

Returns date, np_radar, radar_value, np_sensor, sensor_value : tupple

The data read

CHAPTER

ELEVEN

PYRAD.IO.WRITE_DATA

Functions for writing pyrad output data

send_msg(sender, receiver_list, subject, fname)	sends the content of a text file by email
write_alarm_msg(radar_name, param_name_unit,)	writes an alarm file
write_last_state(datetime_last, fname)	writes SwissMetNet data in format datetime,avg_value,
	std_value
write_smn(datetime_vec, value_avg_vec,)	writes SwissMetNet data in format datetime,avg_value,
	std_value
write_rhi_profile(hvec, data, nvalid_vec,)	writes the values of an RHI profile in a text file
write_field_coverage(quantiles, values,)	writes the quantiles of the coverage on a particular sector
<pre>write_cdf(quantiles, values, ntot, nnan,)</pre>	writes a cumulative distribution function
<pre>write_ts_polar_data(dataset, fname)</pre>	writes time series of data
<pre>write_ts_cum(dataset, fname)</pre>	writes time series accumulation of data
write_monitoring_ts(start_time, np_t,)	writes time series of data
<pre>write_intercomp_scores_ts(start_time, stats,)</pre>	writes time series of radar intercomparison scores
write_colocated_gates(coloc_gates, fname)	Writes the position of gates colocated with two radars
write_colocated_data(coloc_data, fname)	Writes the data of gates colocated with two radars
write_colocated_data_time_avg(coloc_data,	Writes the time averaged data of gates colocated with two
fname)	radars
write_sun_hits(sun_hits, fname)	Writes sun hits data.
write_sun_retrieval(sun_retrieval, fname)	Writes sun retrieval data.
<pre>generate_field_name_str(datatype)</pre>	Generates a field name in a nice to read format.

pyrad.io.write_data.send_msg(sender, receiver_list, subject, fname)
sends the content of a text file by email

Parameters sender: str

the email address of the sender

receiver_list : list of string

list with the email addresses of the receiver

subject : str

the subject of the email

fname : str

name of the file containing the content of the email message

Returns fname: str

the name of the file containing the content

```
pyrad.io.write_data.write_alarm_msg(radar_name, param_name_unit,
                                                                                      date last,
                                                  tol_abs, np_trend, value_trend, tol_trend, nevents,
                                                  np_last, value_last, fname)
     writes an alarm file
           Parameters radar_name : str
                   Name of the radar being controlled
               param name unit: str
                   Parameter and units
               date_last : datetime object
                   date of the current event
               target, tol_abs: float
                   Target value and tolerance
               np_trend: int
                   Total number of points in trend
               value_trend, tol_trend: float
                   Trend value and tolerance
               nevents: int
                   Number of events in trend
               np_last: int
                   Number of points in the current event
               value last: float
                   Value of the current event
               fname: str
                   Name of file where to store the alarm information
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write data.write cdf (quantiles, values, ntot, nnan, nclut, nblocked, nprec filter, nout-
                                          liers, ncdf, fname, use_nans=False, nan_value=0.0, filterprec=[],
                                          vismin=None, sector=None, datatype=None, timeinfo=None)
     writes a cumulative distribution function
           Parameters quantiles: datetime array
                   array containing the measurement time
               values: float array
                   array containing the average value
               fname: float array
                   array containing the standard deviation
               sector: str
```

file name where to store the data

```
Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_colocated_data(coloc_data, fname)
     Writes the data of gates colocated with two radars
           Parameters coloc data: dict
                   dictionary containing the colocated data parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_colocated_data_time_avg(coloc_data,fname)
     Writes the time averaged data of gates colocated with two radars
           Parameters coloc data: dict
                   dictionary containing the colocated data parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_colocated_gates (coloc_gates, fname)
     Writes the position of gates colocated with two radars
           Parameters coloc_gates: dict
                   dictionary containing the colocated gates parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_field_coverage (quantiles, values, ele_start, ele_stop, azi_start,
                                                         azi_stop, threshold, nvalid_min, datatype, time-
                                                         info, fname)
     writes the quantiles of the coverage on a particular sector
           Parameters quantiles: datetime array
                   array containing the quantiles computed
               values: float array
                   quantile value
               ele_start, ele_stop, azi_start, azi_stop: float
                   The limits of the sector
               threshold: float
```

The minimum value to consider the data valid

```
nvalid min: int
                   the minimum number of points to consider that there are values in a ray
               datatype: str
                   data type and units
               timeinfo: datetime object
                   the time stamp of the data
               fname: str
                   name of the file where to write the data
          Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_intercomp_scores_ts(start_time,
                                                                                stats,
                                                                                            field_name,
                                                                              rad1_name='RADAR001',
                                                               fname,
                                                               rad2 name='RADAR002'
     writes time series of radar intercomparison scores
          Parameters start_time : datetime object
                   the time of the intercomparison
               stats: dict
                   dictionary containing the statistics
               field name: str
                   The name of the field
               fname: str
                   file name where to store the data
               rad1_name, rad2_name: str
                   Name of the radars intercompared
          Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_last_state(datetime_last, fname)
     writes SwissMetNet data in format datetime,avg_value, std_value
          Parameters datetime last: datetime object
                   date and time of the last state
               fname: str
                   file name where to store the data
          Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_monitoring_ts(start_time, np_t, values, quantiles, datatype,
                                                       fname)
     writes time series of data
          Parameters start_time : datetime object
```

```
the time of the monitoring
               np_t: int
                    the total number of points
               values: float array
                    the values at certain quantiles
               quantiles: float array
                   the quantiles computed
               fname: str
                    file name where to store the data
           Returns fname: str
                    the name of the file where data has written
pyrad.io.write_data.write_rhi_profile (hvec, data, nvalid_vec, labels, fname, datatype=None,
                                                       timeinfo=None, sector=None)
      writes the values of an RHI profile in a text file
           Parameters hvec: float array
                   array containing the alitude in m MSL
               data: list of float array
                    the quantities at each altitude
               nvalid_vec: int array
                    number of valid data points used to compute the quantiles
               labels: list of strings
                   label specifying the quantitites in data
               fname: str
                    file name where to store the data
               datatype: str
                    the data type
               timeinfo: datetime object
                    time of the rhi profile
               sector: dict
                    dictionary specying the sector limits
           Returns fname: str
                   the name of the file where data has been written
pyrad.io.write_data.write_smn (datetime_vec, value_avg_vec, value_std_vec, fname)
      writes SwissMetNet data in format datetime,avg_value, std_value
           Parameters datetime_vec : datetime array
                    array containing the measurement time
               value_avg_vec : float array
```

array containing the average value

```
value_std_vec : float array
                   array containing the standard deviation
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_sun_hits(sun_hits, fname)
     Writes sun hits data.
           Parameters sun_hits: dict
                   dictionary containing the sun hits parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_sun_retrieval(sun_retrieval, fname)
     Writes sun retrieval data.
           Parameters sun retrieval: dict
                   dictionary containing the sun retrieval parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_ts_cum (dataset, fname)
     writes time series accumulation of data
           Parameters dataset : dict
                   dictionary containing the time series parameters
               fname: str
                   file name where to store the data
           Returns fname: str
                   the name of the file where data has written
pyrad.io.write_data.write_ts_polar_data(dataset, fname)
     writes time series of data
           Parameters dataset : dict
                   dictionary containing the time series parameters
               fname: str
                   file name where to store the data
```

Returns fname: str

the name of the file where data has written

byrad library reference for developers, Release 0.0.1	

CHAPTER

TWELVE

PYRAD.IO.IO_AUX

Auxiliary functions for reading/writing files

map_hydro(hydro_data_op)	maps the operational hydrometeor classification identifiers
	to the ones
get_save_dir(basepath, procname, dsname, prdname)	obtains the path to a product directory and eventually cre-
	ates it
<pre>make_filename(prdtype, dstype, dsname, ext)</pre>	creates a product file name
<pre>generate_field_name_str(datatype)</pre>	Generates a field name in a nice to read format.
<pre>get_datatype_metranet(datatype)</pre>	maps de config file radar data type name into the corre-
	sponding metranet
<pre>get_fieldname_pyart(datatype)</pre>	maps the config file radar data type name into the corre-
	sponding rainbow
<pre>get_fieldname_cosmo(field_name)</pre>	maps the Py-ART field name into the corresponding
	COSMO variable name
<pre>get_field_unit(datatype)</pre>	Return unit of datatype.
<pre>get_field_name(datatype)</pre>	Return long name of datatype.
<pre>get_file_list(datadescriptor, starttime,)</pre>	gets the list of files with a time period
<pre>get_scan_list(scandescriptor_list)</pre>	determine which is the scan list for each radar
<pre>get_new_rainbow_file_name(master_fname,)</pre>	get the rainbow file name containing datatype from a mas-
	ter file name
<pre>get_datatype_fields(datadescriptor)</pre>	splits the data type descriptor and provides each individual
	member
<pre>get_dataset_fields(datasetdescr)</pre>	splits the dataset type descriptor and provides each individ-
	ual member
<pre>get_datetime(fname, datadescriptor)</pre>	gets date and time from file name
find_raw_cosmo_file(voltime, datatype, cfg)	Search a COSMO file in netcdf format
find_cosmo_file(voltime, datatype, cfg, scanid)	Search a COSMO file in Rainbow format
<pre>find_hzt_file(voltime, cfg[, ind_rad])</pre>	Search an ISO-0 degree file in HZT format
<pre>find_rad4alpcosmo_file(voltime, datatype,)</pre>	Search a COSMO file

pyrad.io.io_aux.find_cosmo_file (voltime, datatype, cfg, scanid, ind_rad=0)

Search a COSMO file in Rainbow format

Parameters voltime: datetime object

volume scan time

datatype : str

type of COSMO data to look for

cfg: dictionary of dictionaries

```
configuration info to figure out where the data is
               scanid: str
                   name of the scan
               ind_rad: int
                   radar index
           Returns fname: str
                   Name of COSMO file if it exists. None otherwise
pyrad.io.io_aux.find_hzt_file (voltime, cfg, ind_rad=0)
     Search an ISO-0 degree file in HZT format
           Parameters voltime: datetime object
                   volume scan time
               cfg: dictionary of dictionaries
                   configuration info to figure out where the data is
               ind rad: int
                   radar index
           Returns fname: str
                   Name of HZT file if it exists. None otherwise
pyrad.io.io_aux.find_rad4alpcosmo_file (voltime, datatype, cfg, scanid, ind_rad=0)
     Search a COSMO file
           Parameters voltime: datetime object
                   volume scan time
               datatype: str
                   type of COSMO data to look for
               cfg: dictionary of dictionaries
                   configuration info to figure out where the data is
               ind rad: int
                   radar index
           Returns fname: str
                   Name of COSMO file if it exists. None otherwise
               scanid: str
                   name of the scan
pyrad.io.io_aux.find_raw_cosmo_file (voltime, datatype, cfg, ind_rad=0)
     Search a COSMO file in netcdf format
           Parameters voltime: datetime object
                   volume scan time
               datatype: str
                   type of COSMO data to look for
```

```
cfg: dictionary of dictionaries
                  configuration info to figure out where the data is
               ind_rad: int
                  radar index
          Returns fname: str
                   Name of COSMO file if it exists. None otherwise
pyrad.io.io_aux.generate_field_name_str(datatype)
     Generates a field name in a nice to read format.
          Parameters datatype: str
                  The data type
          Returns field_str: str
                  The field name
pyrad.io.io aux.get dataset fields(datasetdescr)
     splits the dataset type descriptor and provides each individual member
          Parameters datasetdescr: str
                  dataset type. Format : [processing level]:[dataset type]
          Returns proclevel: str
                   dataset processing level
               dataset : str
                   dataset type, i.e. dBZ, ZDR, ISO0, ...
pyrad.io.io_aux.get_datatype_fields (datadescriptor)
     splits the data type descriptor and provides each individual member
          Parameters datadescriptor: str
                   radar field type. Format : [radar file type]:[datatype]
          Returns radarnr: str
                  radar number, i.e. RADAR1, RADAR2, ...
               datagroup: str
                   data type group, i.e. RAINBOW, RAD4ALP, CFRADIAL, COSMO, MXPOL ...
               datatype: str
                   data type, i.e. dBZ, ZDR, ISO0, ...
               dataset : str
                   dataset type (for saved data only)
               product: str
                  product type (for saved data only)
pyrad.io.io_aux.get_datatype_metranet(datatype)
     maps de config file radar data type name into the corresponding metranet data type name and Py-ART field
     name
```

Parameters datatype: str

config file radar data type name

```
Returns metranet type: dict
                  dictionary containing the metranet data type name and its corresponding Py-ART field
pyrad.io.io aux.get datetime(fname, datadescriptor)
     gets date and time from file name
          Parameters fname: file name
              datadescriptor: str
                  radar field type. Format : [radar file type]:[datatype]
          Returns fdatetime: datetime object
                  date and time in file name
pyrad.io.io_aux.get_field_name(datatype)
     Return long name of datatype.
          Parameters datatype: str
                  The data type
          Returns name: str
                  The name
pyrad.io.io_aux.get_field_unit (datatype)
     Return unit of datatype.
          Parameters datatype: str
                  The data type
          Returns unit: str
                  The unit
pyrad.io.io_aux.get_fieldname_cosmo (field_name)
     maps the Py-ART field name into the corresponding COSMO variable name
          Parameters field_name : str
                  Py-ART field name
          Returns cosmo name: str
                  Py-ART variable name
pyrad.io.io_aux.get_fieldname_pyart (datatype)
     maps the config file radar data type name into the corresponding rainbow Py-ART field name
          Parameters datatype: str
                  config file radar data type name
          Returns field_name: str
                  Py-ART field name
pyrad.io.io_aux.get_file_list (datadescriptor, starttime, endtime, cfg, scan=None)
     gets the list of files with a time period
          Parameters datadescriptor: str
```

```
radar field type. Format : [radar file type]:[datatype]
               startime: datetime object
                   start of time period
               endtime: datetime object
                   end of time period
               cfg: dictionary of dictionaries
                   configuration info to figure out where the data is
               scan: str
                   scan name
           Returns radar: Radar
                   radar object
pyrad.io.io_aux.get_new_rainbow_file_name(master_fname,
                                                                                  master_datadescriptor,
     get the rainbow file name containing datatype from a master file name and data type
           Parameters master_fname : str
                   the master file name
               master datadescriptor: str
                   the master data type descriptor
               datatype: str
                   the data type of the new file name to be created
           Returns new_fname : str
                   the new file name
                                                    procname,
pyrad.io.io_aux.get_save_dir(basepath,
                                                                  dsname,
                                                                             prdname,
                                                                                         timeinfo=None,
                                        timeformat='%Y-%m-%d', create_dir=True)
     obtains the path to a product directory and eventually creates it
           Parameters basepath: str
                   product base path
               procname: str
                   name of processing space
               dsname: str
                   data set name
               prdname: str
                   product name
               timeinfo: datetime
                   time info to generate the date directory. If None there is no time format in the path
               timeformat: str
                   Optional. The time format.
               create_dir: boolean
```

```
If True creates the directory
           Returns savedir: str
                   path to product
pyrad.io.io_aux.get_scan_list(scandescriptor_list)
     determine which is the scan list for each radar
           Parameters scandescriptor: list of string
                   the list of all scans for all radars
           Returns scan list: list of lists
                   the list of scans corresponding to each radar
pyrad.io.io_aux.make_filename (prdtype, dstype, dsname, ext, prdcfginfo=None, timeinfo=None,
                                          timeformat='%Y%m%d%H%M%S', runinfo=None)
     creates a product file name
           Parameters timeinfo: datetime
                   time info to generate the date directory
               prdtype: str
                   product type, i.e. 'ppi', etc.
               dstype: str
                   data set type, i.e. 'raw', etc.
               dsname: str
                   data set name
               ext: array of str
                   file name extensions, i.e. 'png'
               prdcfginfo: str
                   Optional. string to add product configuration information, i.e. 'el0.4'
               timeformat: str
                   Optional. The time format
               runinfo: str
                   Optional. Additional information about the test (e.g. 'RUN01', 'TS011')
           Returns fname_list: list of str
                   list of file names (as many as extensions)
pyrad.io.io_aux.map_hydro(hydro_data_op)
     maps the operational hydrometeor classification identifiers to the ones used by Py-ART
           Parameters hydro_data_op: numpy array
                   The operational hydrometeor classification data
           Returns hydro_data_py: numpy array
                   The pyart hydrometeor classification data
```

CHAPTER

THIRTEEN

PYRAD.GRAPH.PLOTS

Functions to plot Pyrad datasets

plot_surface(grid, field_name, level,)	plots a surface from gridded data
<pre>plot_latitude_slice(grid, field_name, lon,)</pre>	plots a latitude slice from gridded data
<pre>plot_longitude_slice(grid, field_name, lon,)</pre>	plots a longitude slice from gridded data
<pre>plot_latlon_slice(grid, field_name, coord1,)</pre>	plots a croos section crossing two points in the grid
<pre>plot_ppi(radar, field_name, ind_el, prdcfg,)</pre>	plots a PPI
<pre>plot_ppi_map(radar, field_name, ind_el,)</pre>	plots a PPI on a geographic map
<pre>plot_rhi(radar, field_name, ind_az, prdcfg,)</pre>	plots an RHI
<pre>plot_bscope(radar, field_name, ind_sweep,)</pre>	plots a B-Scope (angle-range representation)
<pre>plot_time_range(radar, field_name,)</pre>	plots a time-range plot
<pre>plot_cappi(radar, field_name, altitude,)</pre>	plots a Constant Altitude Plan Position Indicator CAPPI
plot_rhi_profile(data, hvec, fname_list[,])	plots an RHI profile
plot_along_coord(xval, yval, fname_list[,])	plots a time series
<pre>plot_field_coverage(xval, yval, fname_list)</pre>	plots a time series
<pre>plot_density(hist_obj, hist_type,[,])</pre>	density plot (angle-values representation)
<pre>plot_scatter(bins1, bins2, hist_2d,[,])</pre>	2D histogram
<pre>plot_quantiles(quant, value, fname_list[,])</pre>	plots quantiles
<pre>plot_histogram(bins, values, fname_list[,])</pre>	computes and plots histogram
<pre>plot_histogram2(bins, hist, fname_list[,])</pre>	plots histogram
<pre>plot_antenna_pattern(antpattern, fname_list)</pre>	plots an antenna pattern
<pre>plot_timeseries(tvec, data, fname_list[,])</pre>	plots a time series
<pre>plot_timeseries_comp(date1, value1, date2,)</pre>	plots 2 time series in the same graph
<pre>plot_monitoring_ts(date, np_t, cquant,)</pre>	plots a time series of monitoring data
<pre>plot_scatter_comp(value1, value2, fname_list)</pre>	plots the scatter between two time series
plot_intercomp_scores_ts(date_vec, np_vec,)	plots a time series of radar intercomparison scores
<pre>plot_sun_hits(field, field_name, fname_list,)</pre>	plots the sun hits
<pre>plot_sun_retrieval_ts(sun_retrieval,[, dpi])</pre>	plots sun retrieval time series series
<pre>get_colobar_label(field_dict, field_name)</pre>	creates the colorbar label using field metadata
<pre>get_field_name(field_dict, field)</pre>	Return a nice field name for a particular field
<pre>get_norm(field_name)</pre>	Computes the normalization of the colormap, and gets the
	ticks and labels of the colorbar from the metadata of the
	field.

Parameters field_dict : dict

dictionary containing field metadata

```
field name: str
                    name of the field
           Returns label: str
                    colorbar label
pyrad.graph.plots.get_field_name (field_dict, field)
      Return a nice field name for a particular field
           Parameters field_dict : dict
                    dictionary containing field metadata
               field: str
                   name of the field
           Returns field_name: str
                   the field name
pyrad.graph.plots.get_norm(field_name)
      Computes the normalization of the colormap, and gets the ticks and labels of the colorbar from the metadata of
      the field. Returns None if the required parameters are not present in the metadata
           Parameters field name: str
                   name of the field
           Returns norm: list
                    the colormap index
               ticks: list
                    the list of ticks in the colorbar
               labels: list
                   the list of labels corresponding to each tick
pyrad.graph.plots.plot_along_coord(xval, yval, fname_list, labelx='coord', labely='Value', la-
                                                  bels=None, title='Plot along coordinate', colors=None,
                                                  linestyles=None, ymin=None, ymax=None, dpi=72)
      plots a time series
           Parameters xval: list of float arrays
                    the x values, range, azimuth or elevation
               yval: list of float arrays
                    the y values. Parameter to plot
               fname list: list of str
                    list of names of the files where to store the plot
               labelx: str
                    The label of the X axis
               labely: str
                    The label of the Y axis
               labels: array of str
```

```
title : str
                    The figure title
                colors: array of str
                    Specifies the colors of each line
                linestyles: array of str
                    Specifies the line style of each line
                ymin, ymax: float
                    Lower/Upper limit of y axis
                dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_antenna_pattern (antpattern, fname_list, labelx='Angle [Deg]', lin-
                                                         ear=False, twoway=False, title='Antenna Pattern',
                                                         ymin=None, ymax=None, dpi=72)
      plots an antenna pattern
           Parameters antpattern: dict
                    dictionary with the angle and the attenuation
                value: float array
                    values of the time series
                fname_list : list of str
                    list of names of the files where to store the plot
                labelx: str
                    The label of the X axis
                linear: boolean
                    if true data is in linear units
                linear: boolean
                    if true data represents the two way attenuation
                titl: str
                    The figure title
                ymin, ymax: float
                    Lower/Upper limit of y axis
                dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
```

The label of the legend

```
pyrad.graph.plots.plot_bscope (radar, field_name, ind_sweep, prdcfg, fname_list)
      plots a B-Scope (angle-range representation)
           Parameters radar: Radar object
                    object containing the radar data to plot
                field name: str
                    name of the radar field to plot
                ind_sweep : int
                    sweep index to plot
                prdcfg: dict
                    dictionary containing the product configuration
                fname_list : list of str
                    list of names of the files where to store the plot
           Returns fname list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_cappi (radar, field_name, altitude, prdcfg, fname_list)
      plots a Constant Altitude Plan Position Indicator CAPPI
           Parameters radar: Radar object
                    object containing the radar data to plot
                field_name : str
                    name of the radar field to plot
                altitude: float
                    the altitude [m MSL] to be plotted
                prdcfg: dict
                    dictionary containing the product configuration
                fname list: list of str
                    list of names of the files where to store the plot
           Returns fname list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_density (hist_obj, hist_type, field_name, ind_sweep, prdcfg, fname_list,
                                             quantiles=[25.0, 50.0, 75.0], ref_value=0.0)
      density plot (angle-values representation)
           Parameters hist_obj : histogram object
                    object containing the histogram data to plot
                hist_type : str
                    type of histogram (instantaneous data or cumulative)
                field_name : str
                    name of the radar field to plot
                ind_sweep : int
```

```
sweep index to plot
               prdcfg: dict
                   dictionary containing the product configuration
               fname_list: list of str
                    list of names of the files where to store the plot
               quantiles: array
                   the quantile lines to plot
               ref_value: float
                    the reference value
           Returns fname_list : list of str
                    list of names of the created plots
pyrad.graph.plots.plot_field_coverage(xval, yval, fname_list, labelx='Azimuth (deg)',
                                                      labely='Range extension [m]', labels=None, ti-
                                                      tle='Field coverage', ymin=None, ymax=None,
                                                                           ymeanval=None,
                                                      xmeanval=None,
                                                                                                labelmean-
                                                       val=None, dpi=72)
      plots a time series
           Parameters xval: list of float arrays
                   the x values, azimuth
               yval: list of float arrays
                   the y values. Range extension
               fname_list : list of str
                   list of names of the files where to store the plot
               labelx: str
                   The label of the X axis
               labely: str
                   The label of the Y axis
               labels: array of str
                    The label of the legend
               title : str
                    The figure title
               ymin, ymax: float
                    Lower/Upper limit of y axis
               xmeanval, ymeanval: float array
                   the x and y values of a mean along elevation
               labelmeanval: str
```

the label of the mean

dpi: int

```
dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_histogram(bins, values, fname_list, labelx='bins', labely='Number of
                                                Samples', titl='histogram', dpi=72)
      computes and plots histogram
           Parameters bins: array
                   histogram bins
               values : array
                   data values
               fname_list : list of str
                    list of names of the files where to store the plot
               labelx: str
                   The label of the X axis
               labely: str
                   The label of the Y axis
               titl: str
                   The figure title
               dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_histogram2 (bins, hist, fname_list, labelx='bins', labely='Number of
                                                 Samples', titl='histogram', dpi=72)
      plots histogram
           Parameters quant : array
                   histogram bins
               hist: array
                   values for each bin
               fname_list : list of str
                    list of names of the files where to store the plot
               labelx: str
                   The label of the X axis
               labely: str
                   The label of the Y axis
               titl: str
                   The figure title
               dpi: int
```

```
Returns fname_list: list of str
                   list of names of the created plots
pyrad.graph.plots.plot_intercomp_scores_ts(date_vec,
                                                                         np_vec,
                                                                                    meanbias_vec,
                                                             dianbias vec,
                                                                              modebias vec,
                                                             slope_vec, intercep_vec, intercep_slope1_vec,
                                                             fname list, ref value=0.0, labelx='Time
                                                             UTC', titl='RADAR001-RADAR002 intercom-
                                                             parison', dpi=72)
     plots a time series of radar intercomparison scores
           Parameters date_vec : datetime object
                   time of the time series
               np_vec : int array
                   number of points
               meanbias_vec, medianbias_vec, modebias_vec : float array
                   mean, median and mode bias
               corr_vec : float array
                   correlation
               slope_vec, intercep_vec : float array
                   slope and intercep of a linear regression
               intercep_slope1_vec : float
                   the intercep point of a inear regression of slope 1
               ref_value: float
                   the reference value
               labelx: str
                   The label of the X axis
               titl: str
                   The figure title
           Returns fname_list: list of str
                   list of names of the created plots
               dpi: int
                   dots per inch
pyrad.graph.plots.plot_latitude_slice(grid, field_name, lon, lat, prdcfg, fname_list)
     plots a latitude slice from gridded data
           Parameters grid: Grid object
                   object containing the gridded data to plot
               field_name : str
                   name of the radar field to plot
```

dots per inch

lon, lat: float

```
coordinates of the slice to plot
                prdcfg: dict
                    dictionary containing the product configuration
                fname_list: list of str
                    list of names of the files where to store the plot
           Returns fname list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_latlon_slice(grid, field_name, coord1, coord2, prdcfg, fname_list)
      plots a croos section crossing two points in the grid
           Parameters grid: Grid object
                    object containing the gridded data to plot
                field_name : str
                    name of the radar field to plot
                coord1: tupple of floats
                    lat, lon of the first point
                coord2: tupple of floats
                    lat, lon of the second point
                fname_list : list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_longitude_slice (grid, field_name, lon, lat, prdcfg, fname_list)
      plots a longitude slice from gridded data
           Parameters grid: Grid object
                    object containing the gridded data to plot
                field name: str
                    name of the radar field to plot
                lon, lat: float
                    coordinates of the slice to plot
                prdcfg : dict
                    dictionary containing the product configuration
                fname_list : list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
```

```
pyrad.graph.plots.plot_monitoring_ts(date, np_t, cquant, lquant, hquant, field_name,
                                                     fname_list, ref_value=None, labelx='Time [UTC]', la-
                                                     bely='Value', titl='Time Series', dpi=72)
     plots a time series of monitoring data
           Parameters date: datetime object
                   time of the time series
               np t: int array
                   number of points
               cquant, lquant, hquant : float array
                   values of the central, low and high quantiles
               field_name: str
                   name of the field
               fname_list : list of str
                   list of names of the files where to store the plot
               ref value: float
                   the reference value
               labelx: str
                   The label of the X axis
               labely: str
                   The label of the Y axis
               titl: str
                   The figure title
               dpi: int
                   dots per inch
           Returns fname_list: list of str
                   list of names of the created plots
pyrad.graph.plots.plot_ppi(radar, field_name, ind_el, prdcfg, fname_list, plot_type='PPI',
                                      step=None, quantiles=None)
     plots a PPI
           Parameters radar: Radar object
                   object containing the radar data to plot
               field name: str
                   name of the radar field to plot
               ind el: int
                   sweep index to plot
               prdcfg: dict
                   dictionary containing the product configuration
               fname_list : list of str
```

```
list of names of the files where to store the plot
                plot_type: str
                    type of plot (PPI, QUANTILES or HISTOGRAM)
                step: float
                    step for histogram plotting
                quantiles: float array
                    quantiles to plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_ppi_map (radar, field_name, ind_el, prdcfg, fname_list)
      plots a PPI on a geographic map
           Parameters radar: Radar object
                    object containing the radar data to plot
                field name: str
                    name of the radar field to plot
                ind_el: int
                    sweep index to plot
                prdcfg : dict
                    dictionary containing the product configuration
                fname_list : list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_quantiles (quant, value, fname_list, labelx='quantile', labely='value',
                                                titl='quantile', dpi=72)
      plots quantiles
           Parameters quant : array
                    quantiles to be plotted
                value: array
                    values of each quantile
                fname_list : list of str
                    list of names of the files where to store the plot
                labelx: str
                    The label of the X axis
                labely: str
                    The label of the Y axis
                titl: str
```

```
The figure title
               dpi: int
                   dots per inch
           Returns fname_list: list of str
                   list of names of the created plots
pyrad.graph.plots.plot_rhi (radar, field_name, ind_az, prdcfg, fname_list, plot_type='RHI',
                                      step=None, quantiles=None)
     plots an RHI
           Parameters radar: Radar object
                   object containing the radar data to plot
               field_name: str
                   name of the radar field to plot
               ind_az : int
                   sweep index to plot
               prdcfg : dict
                   dictionary containing the product configuration
               fname list: list of str
                   list of names of the files where to store the plot
               plot_type : str
                   type of plot (PPI, QUANTILES or HISTOGRAM)
               step: float
                   step for histogram plotting
               quantiles: float array
                   quantiles to plot
           Returns fname_list: list of str
                   list of names of the created plots
pyrad.graph.plots.plot_rhi_profile(data, hvec, fname_list, labelx='Value', labely='Height
                                                  (m MSL)', labels=['Mean'], title='RHI profile', col-
                                                  ors=None, linestyles=None, xmin=None, xmax=None,
                                                  dpi=72)
     plots an RHI profile
           Parameters data: list of float array
                   values of the profile
               hvec: float array
                   height points of the profile
               fname_list : list of str
                   list of names of the files where to store the plot
               labelx: str
```

The label of the X axis

```
labely: str
                    The label of the Y axis
                labels: array of str
                    The label of the legend
                title: str
                    The figure title
                colors: array of str
                    Specifies the colors of each line
                linestyles: array of str
                    Specifies the line style of each line
                xmin, xmax: float
                    Lower/Upper limit of y axis
                dpi: int
                    dots per inch
           Returns fname list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_scatter(bins1, bins2, hist_2d, field_name1, field_name2, fname_list,
                                             prdcfg, metadata=None, lin_regr=None, lin_regr_slope1=None,
                                             rad1_name='RADAR001', rad2_name='RADAR002')
      2D histogram
           Parameters bins1, bins2: float array2
                    the bins of each field
                hist_2d: ndarray 2D
                    the 2D histogram
                field_name1, field_name2 : str
                    the names of each field
                fname_list : list of str
                    list of names of the files where to store the plot
                prdcfg: dict
                    product configuration dictionary
                metadata: str
                    a string with metadata to write in the plot
                lin_regr: tupple with 2 values
                    the coefficients for a linear regression
                lin_regr_slope1 : float
                    the intercep point of a linear regression of slope 1
```

```
rad1_name, rad2_name : str
                    name of the radars which data is used
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_scatter_comp(value1, value2, fname_list, labelx='Sensor 1', la-
                                                    bely='Sensor 2', titl='Scatter', axis=None, meta-
                                                    data=None, dpi=72)
      plots the scatter between two time series
           Parameters value1: float array
                    values of the first time series
               value2: float array
                    values of the second time series
               fname_list : list of str
                   list of names of the files where to store the plot
               labelx : str
                   The label of the X axis
               labely: str
                   The label of the Y axis
               titl: str
                   The figure title
               axis: str
                   type of axis
               metadata: string
                   a string containing metadata
               dpi: int
                    dots per inch
           Returns fname list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_sun_hits (field, field_name, fname_list, prdcfg)
      plots the sun hits
           Parameters radar: Radar object
                   object containing the radar data to plot
               field_name: str
                    name of the radar field to plot
               altitude: float
                    the altitude [m MSL] to be plotted
               prdcfg: dict
```

dictionary containing the product configuration

```
fname list: list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_sun_retrieval_ts (sun_retrieval, data_type, fname_list, dpi=72)
      plots sun retrieval time series series
           Parameters sun_retrieval: tuple
                    tuple containing the retrieved parameters
               data_type: str
                    parameter to be plotted
               fname_list : list of str
                    list of names of the files where to store the plot
               dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_surface (grid, field_name, level, prdcfg, fname_list)
      plots a surface from gridded data
           Parameters grid: Grid object
                    object containing the gridded data to plot
               field_name : str
                    name of the radar field to plot
               level: int
                    level index
               prdcfg: dict
                    dictionary containing the product configuration
               fname list: list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_time_range (radar, field_name, ind_sweep, prdcfg, fname_list)
      plots a time-range plot
           Parameters radar: Radar object
                    object containing the radar data to plot
               field_name: str
                    name of the radar field to plot
               ind_sweep : int
```

```
sweep index to plot
                prdcfg: dict
                    dictionary containing the product configuration
                fname_list: list of str
                    list of names of the files where to store the plot
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_timeseries(tvec,
                                                                 fname_list,
                                                                               labelx='Time [UTC]', la-
                                                         data,
                                                  bely='Value', labels=['Sensor'], title='Time Series', pe-
                                                 riod=0, timeformat=None, colors=None, linestyles=None,
                                                 markers=None, ymin=None, ymax=None, dpi=72)
      plots a time series
           Parameters tvec: datetime object
                    time of the time series
                data: list of float array
                    values of the time series
                fname_list : list of str
                    list of names of the files where to store the plot
                labelx : str
                    The label of the X axis
                labely: str
                    The label of the Y axis
                labels: array of str
                    The label of the legend
                title: str
                    The figure title
                period: float
                    measurement period in seconds used to compute accumulation. If 0 no accumulation is
                    computed
                timeformat : str
                    Specifies the tvec and time format on the x axis
                colors: array of str
                    Specifies the colors of each line
                linestyles: array of str
                    Specifies the line style of each line
                markers: array of str
```

Specify the markers to be used for each line

ymin, ymax: float

Lower/Upper limit of y axis

```
dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
pyrad.graph.plots.plot_timeseries_comp(date1, value1, date2, value2, fname_list, la-
                                                        belx='Time [UTC]', labely='Value', label1='Sensor
                                                         1', label2='Sensor 2', titl='Time Series Compari-
                                                        son', period1=0, period2=0, dpi=72)
      plots 2 time series in the same graph
           Parameters date1: datetime object
                    time of the first time series
               value1: float array
                    values of the first time series
               date2: datetime object
                    time of the second time series
               value2: float array
                    values of the second time series
               fname list: list of str
                    list of names of the files where to store the plot
               labelx: str
                    The label of the X axis
               labely: str
                    The label of the Y axis
               label1, label2: str
                    legend label for each time series
               titl: str
                      The figure title
                    period1, period2 [float] measurement period in seconds used to compute accumula-
                      tion. If 0 no accumulation is computed
               dpi: int
                    dots per inch
           Returns fname_list: list of str
                    list of names of the created plots
```

CHAPTER

FOURTEEN

PYRAD.UTIL.RADAR_UTILS

Miscellaneous functions dealing with radar data

get_ROI(radar, fieldname, sector)	filter out any data outside the region of interest defined by
	sector
rainfall_accumulation(t_in_vec, val_in_vec)	Computes the rainfall accumulation of a time series over a
	given period
time_series_statistics(t_in_vec, val_in_vec)	Computes statistics over a time-averaged series
<pre>join_time_series(t1, val1, t2, val2[, dropnan])</pre>	joins time_series
<pre>get_range_bins_to_avg(rad1_rng, rad2_rng)</pre>	Compares the resolution of two radars and determines if
	and which radar
<pre>find_ray_index(ele_vec, azi_vec, ele, azi[,])</pre>	Find the ray index corresponding to a particular elevation
	and azimuth
<pre>find_rng_index(rng_vec, rng[, rng_tol])</pre>	Find the range index corresponding to a particular range
time_avg_range(timeinfo, avg_starttime,)	finds the new start and end time of an averaging
<pre>get_closest_solar_flux(hit_datetime_list,)</pre>	finds the solar flux measurement closest to the sun hit
<pre>create_sun_hits_field(rad_el, rad_az,)</pre>	creates a sun hits field from the position and power of the
	sun hits
<pre>create_sun_retrieval_field(par, imgcfg)</pre>	creates a sun retrieval field from the retrieval parameters
<pre>compute_quantiles(field[, quantiles])</pre>	computes quantiles
<pre>compute_quantiles_from_hist(bins, hist[,])</pre>	computes quantiles from histograms
<pre>compute_quantiles_sweep(field, ray_start,)</pre>	computes quantiles of a particular sweep
<pre>compute_histogram(field, field_name[, step])</pre>	computes histogram of the data
<pre>compute_histogram_sweep(field, ray_start,)</pre>	computes histogram of the data in a particular sweep
<pre>get_histogram_bins(field_name[, step])</pre>	gets the histogram bins using the range limits of the field as
	defined
compute_2d_stats(field1, field2,[,])	computes a 2D histogram and statistics of the data
compute_1d_stats(field1, field2)	returns statistics of data
<pre>compute_2d_hist(field1, field2, field_name1,)</pre>	computes histogram of the data
<pre>quantize_field(field, field_name, step)</pre>	quantizes data

pyrad.util.radar_utils.compute_1d_stats (field1, field2)
 returns statistics of data

Parameters field1, field2: ndarray 1D

the two fields to compare

Returns stats: dict

a dictionary with statistics

```
field_name1,
                                                                                           field_name2,
pyrad.util.radar_utils.compute_2d_hist (field1,
                                                                field2,
                                                      step1=None, step2=None)
     computes histogram of the data
           Parameters field: ndarray 2D
                   the radar field
               field_name: str
                   name of the field
               step: float
                   size of bin
           Returns bins: float array
                   interval of each bin
               values: float array
                   values at each bin
pyrad.util.radar_utils.compute_2d_stats(field1,
                                                                           field_name1,
                                                                                           field_name2,
                                                                 field2,
                                                        step1=None, step2=None)
     computes a 2D histogram and statistics of the data
           Parameters field1, field2: ndarray 2D
                   the two fields
               field_name1, field_nam2: str
                   the name of the fields
               step1, step2: float
                   size of bin
           Returns hist_2d : array
                   the histogram
               bins1, bins2: float array
                   interval of each bin
               stats: dict
                   a dictionary with statistics
pyrad.util.radar_utils.compute_histogram (field, field_name, step=None)
     computes histogram of the data
           Parameters field: ndarray 2D
                   the radar field
               field name: str
                   name of the field
               step: float
                   size of bin
           Returns bins: float array
                   interval of each bin
```

```
values: float array
                   values at each bin
pyrad.util.radar_utils.compute_histogram_sweep (field, ray_start, ray_end, field_name,
                                                                 step=None)
     computes histogram of the data in a particular sweep
          Parameters field: ndarray 2D
                   the radar field
               ray_start, ray_end: int
                   starting and ending ray indexes
               field_name: str
                   name of the field
               step: float
                   size of bin
          Returns bins: float array
                   interval of each bin
               values: float array
                   values at each bin
pyrad.util.radar_utils.compute_quantiles(field, quantiles=None)
     computes quantiles
          Parameters field: ndarray 2D
                   the radar field
               ray_start, ray_end: int
                   starting and ending ray indexes
               quantiles: float array
                   list of quantiles to compute
          Returns quantiles: float array
                   list of quantiles
               values: float array
                   values at each quantile
pyrad.util.radar_utils.compute_quantiles_from_hist(bins, hist, quantiles=None)
     computes quantiles from histograms
          Parameters bins: ndarray 1D
                   the bins
               hist: ndarray 1D
                   the histogram
               quantiles: float array
                  list of quantiles to compute
```

Returns quantiles: float array

```
list of quantiles
               values: float array
                   values at each quantile
pyrad.util.radar_utils.compute_quantiles_sweep (field,
                                                                          ray_start,
                                                                                       ray_end,
                                                                                                   auan-
                                                                  tiles=None)
     computes quantiles of a particular sweep
           Parameters field: ndarray 2D
                   the radar field
               ray_start, ray_end : int
                   starting and ending ray indexes
               quantiles: float array
                   list of quantiles to compute
           Returns quantiles: float array
                   list of quantiles
               values: float array
                   values at each quantile
pyrad.util.radar_utils.create_sun_hits_field(rad_el, rad_az, sun_el, sun_az, data,
                                                               imgcfg)
     creates a sun hits field from the position and power of the sun hits
           Parameters rad_el, rad_az, sun_el, sun_az : ndarray 1D
                   azimuth and elevation of the radar and the sun respectively in degree
               data: masked ndarray 1D
                   the sun hit data
               imgcfg: dict
                   a dictionary specifying the ranges and resolution of the field to create
           Returns field: masked ndarray 2D
                   the sun hit field
pyrad.util.radar_utils.create_sun_retrieval_field(par, imgcfg)
     creates a sun retrieval field from the retrieval parameters
           Parameters par: ndarray 1D
                   the 5 retrieval parameters
               imgcfg: dict
                   a dictionary specifying the ranges and resolution of the field to create
           Returns field: masked ndarray 2D
                   the sun retrieval field
pyrad.util.radar_utils.find_ray_index(ele_vec, azi_vec, ele, azi, ele_tol=0.0, azi_tol=0.0,
                                                     nearest='azi')
     Find the ray index corresponding to a particular elevation and azimuth
           Parameters ele_vec, azi_vec : float arrays
```

```
The elevation and azimuth data arrays where to look for
               ele, azi: floats
                    The elevation and azimuth to search
               ele_tol, azi_tol: floats
                   Tolerances [deg]
               nearest: str
                   criteria to define wich ray to keep if multiple rays are within tolerance. azi: nearest
                   azimuth, ele: nearest elevation
           Returns ind_ray: int
                   The ray index
pyrad.util.radar_utils.find_rng_index(rng_vec, rng, rng_tol=0.0)
     Find the range index corresponding to a particular range
           Parameters rng_vec: float array
                   The range data array where to look for
               rng: float
                   The range to search
               rng tol: float
                   Tolerance [m]
           Returns ind_rng: int
                   The range index
pyrad.util.radar_utils.get_ROI (radar, fieldname, sector)
     filter out any data outside the region of interest defined by sector
           Parameters radar: radar object
                   the radar object where the data is
               fieldname: str
                   name of the field to filter
               sector: dict
                   a dictionary defining the region of interest
           Returns roi_flag : ndarray
                   a field array with ones in gates that are in the Region of Interest
pyrad.util.radar_utils.get_closest_solar_flux(hit_datetime_list,
                                                                                        flux_datetime_list,
                                                                  flux_value_list)
     finds the solar flux measurement closest to the sun hit
           Parameters hit_datetime_list : datetime array
                   the date and time of the sun hit
               flux_datetime_list : datetime array
                   the date and time of the solar flux measurement
               flux_value_list: ndarray 1D
```

```
the solar flux values
           Returns flux_datetime_closest_list : datetime array
                   the date and time of the solar flux measurement closest to sun hit
               flux_value_closest_list: ndarray 1D
                   the solar flux values closest to the sun hit time
pyrad.util.radar_utils.get_histogram_bins(field_name, step=None)
     gets the histogram bins using the range limits of the field as defined in the Py-ART config file.
           Parameters field_name: str
                   name of the field
               step: float
                   size of bin
           Returns bins: float array
                   interval of each bin
pyrad.util.radar_utils.get_range_bins_to_avg(rad1_rng, rad2_rng)
     Compares the resolution of two radars and determines if and which radar has to be averaged and the length of
     the averaging window
           Parameters rad1 rng: array
                   the range of radar 1
               rad2_rng: datetime
                   the range of radar 2
           Returns avg_rad1, avg_rad2 : Boolean
                   Booleans specifying if the radar data has to be average in range
               avg_rad_lim : array with two elements
                   the limits to the average (centered on each range gate)
pyrad.util.radar_utils.join_time_series(t1, val1, t2, val2, dropnan=False)
     joins time_series
           Parameters t1: datetime array
                   time of first series
               val1: float array
                   value of first series
               t2: datetime array
                   time of second series
               val2: float array
                   value of second series
               dropnan: boolean
                   if True remove NaN from the time series
           Returns t_out_vec : datetime array
```

```
the resultant date time after joining the series
               val1_out_vec : float array
                   value of first series
               val2_out_vec : float array
                   value of second series
pyrad.util.radar_utils.quantize_field(field, field_name, step)
     quantizes data
           Parameters field: ndarray 2D
                   the radar field
               field name: str
                   name of the field
               step: float
                   size of bin
           Returns fieldq: ndarray 2D
                   The quantized field
               values: float array
                   values at each bin
pyrad.util.radar_utils.rainfall_accumulation(t_in_vec, val_in_vec, cum_time=3600.0,
                                                               base_time=0.0, dropnan=False)
     Computes the rainfall accumulation of a time series over a given period
           Parameters t_in_vec : datetime array
                   the input date and time array
               val_in_vec : float array
                   the input values array [mm/h]
               cum_time: int
                   accumulation time [s]
               base time: int
                   base time [s]
               dropnan: boolean
                   if True remove NaN from the time series
           Returns t_out_vec : datetime array
                   the output date and time array
               val_out_vec : float array
                   the output values array
               np_vec : int array
                   the number of samples at each period
pyrad.util.radar_utils.time_avg_range (timeinfo, avg_starttime, avg_endtime, period)
```

finds the new start and end time of an averaging

```
Parameters timeinfo: datetime
                   the current volume time
               avg_starttime: datetime
                   the current average start time
               avg_endtime: datetime
                   the current average end time
               period: float
                   the averaging period
           Returns new_starttime: datetime
                   the new average start time
               new_endtime: datetime
                   the new average end time
pyrad.util.radar_utils.time_series_statistics(t_in_vec, val_in_vec, avg_time=3600,
                                                                base_time=1800, method='mean', drop-
                                                                nan=False)
     Computes statistics over a time-averaged series
           Parameters t_in_vec : datetime array
                   the input date and time array
               val_in_vec : float array
                   the input values array
               avg_time: int
                   averaging time [s]
               base_time: int
                   base time [s]
               method: str
                   statistical method
               dropnan: boolean
                   if True remove NaN from the time series
           Returns t_out_vec : datetime array
                   the output date and time array
               val_out_vec : float array
                   the output values array
```
