pyrad library reference for users

Release 0.1.0

meteoswiss-mdr

Feb 19, 2019

CONTENTS

Contents:

PROCESSING FLOW CONTROL (`PYRAD.FLOW`)

Functions to control the Pyrad data processing flow

main(cfgfile[, starttime, endtime, ...])	Main flow control.
main_rt(cfgfile_list[, starttime, endtime, ...])	main flow control.

pyrad.flow.**main**(*cfgfile*, *starttime=None*, *endtime=None*, *trajfile=''*, *trajtype='plane'*, *flashnr=0*, *in-fostr=''*, *MULTIPROCESSING_DSET=False*, *MULTIPROCESSING_PROD=False*, *PROFILE_MULTIPROCESSING=False*)

> Main flow control. Processes radar data off-line over a period of time given either by the user, a trajectory file, or determined by the last volume processed and the current time. Multiple radars can be processed simultaneously

> **Parameters**

> > **cfgfile** [str] path of the main config file

> > **starttime, endtime** [datetime object] start and end time of the data to be processed

> > **trajfile** [str] path to file describing the trajectory

> > **trajtype** [str] type of trajectory file. Can be either 'plane' or 'lightning'

> > **flashnr** [int] If larger than 0 will select a flash in a lightning trajectory file. If 0 the data corresponding to the trajectory of all flashes will be plotted

> > **infostr** [str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

> > **MULTIPROCESSING_DSET** [Bool] If true the generation of datasets at the same processing level will be parallelized

> > **MULTIPROCESSING_PROD** [Bool] If true the generation of products from each dataset will be parallelized

> > **PROFILE_MULTIPROCESSING** [Bool] If true and code parallelized the multiprocessing is profiled

pyrad.flow.**main_rt**(*cfgfile_list*, *starttime=None*, *endtime=None*, *infostr_list=None*, *proc_period=60*, *proc_finish=None*)

> main flow control. Processes radar data in real time. The start and end processing times can be determined by the user. This function is inteded for a single radar

> **Parameters**

> > **cfgfile_list** [list of str] path of the main config files

> > **starttime, endtime** [datetime object] start and end time of the data to be processed

infostr_list [list of str] Information string about the actual data processing (e.g. 'RUN57'). This string is added to product files.

proc_period [int] period of time before starting a new processing round (seconds)

cronjob_controlled [Boolean] If True means that the program is started periodically from a cronjob and therefore finishes execution after processing

proc_finish [int or None] if set to a value the program will be forced to shut down after the value (in seconds) from start time has been exceeded

Returns

end_proc [Boolean] If true the program has ended successfully

DATASET PROCESSING (`PYRAD.PROC`)

Initiate the dataset processing.

2.1 Auxiliary functions

get_process_func(dataset_type, dsname)	Maps the dataset type into its processing function and data set format associated.
process_raw(procstatus, dscfg[, radar_list])	Dummy function that returns the initial input data set
process_save_radar(procstatus, dscfg[, . . .])	Dummy function that allows to save the entire radar object
process_fixed_rng(procstatus, dscfg[, . . .])	Obtains radar data at a fixed range
process_roi(procstatus, dscfg[, radar_list])	Obtains the radar data at a region of interest.
process_grid(procstatus, dscfg[, radar_list])	Puts the radar data in a regular grid
process_azimuthal_average(procstatus, dscfg)	Averages radar data in azimuth obtaining and RHI as a result

2.2 Echo classification and filtering

process_echo_id(procstatus, dscfg[, radar_list])	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation
process_birds_id(procstatus, dscfg[, radar_list])	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Birds
process_clt_to_echo_id(procstatus, dscfg[, . . .])	Converts clutter exit code from rad4alp into pyrad echo ID
process_echo_filter(procstatus, dscfg[, . . .])	Masks all echo types that are not of the class specified in keyword echo_type
process_cdf(procstatus, dscfg[, radar_list])	Collects the fields necessary to compute the Cumulative Distribution Function
process_filter_snr(procstatus, dscfg[, . . .])	filters out low SNR echoes
process_filter_visibility(procstatus, dscfg)	filters out rays gates with low visibility and corrects the reflectivity
process_outlier_filter(procstatus, dscfg[, . . .])	filters out gates which are outliers respect to the surrounding
process_hydroclass(procstatus, dscfg[, . . .])	Classifies precipitation echoes
process_melting_layer(procstatus, dscfg[, . . .])	Detects the melting layer

Continued on next page

Table 2 – continued from previous page	
process_filter_vel_diff(procstatus, dscfg[, ...])	filters out range gates that could not be used for Doppler velocity estimation
process_zdr_column(procstatus, dscfg[, ...])	Detects ZDR columns

2.3 Phase processing and attenuation correction

process_correct_phidp0(procstatus, dscfg[, ...])	corrects phidp of the system phase
process_smooth_phidp_single_window(...[, ...])	corrects phidp of the system phase and smoothes it using one window
process_smooth_phidp_double_window(...[, ...])	corrects phidp of the system phase and smoothes it using one window
process_kdp_leastsquare_single_window(.. ...])	Computes specific differential phase using a piecewise least square method
process_kdp_leastsquare_double_window(.. ...])	Computes specific differential phase using a piecewise least square method
process_phidp_kdp_Vulpiani(procstatus, dscfg)	Computes specific differential phase and differential phase using the method developed by Vulpiani et al.
process_phidp_kdp_Kalman(procstatus, dscfg)	Computes specific differential phase and differential phase using the Kalman filter as proposed by Schneebeli et al.
process_phidp_kdp_Maesaka(procstatus, dscfg)	Estimates PhiDP and KDP using the method by Maesaka.
process_phidp_kdp_lp(procstatus, dscfg[, ...])	Estimates PhiDP and KDP using a linear programming algorithm.
process_attenuation(procstatus, dscfg[, ...])	Computes specific attenuation and specific differential attenuation using the Z-Phi method and corrects reflectivity and differential reflectivity

2.4 Monitoring, calibration and noise correction

process_correct_bias(procstatus, dscfg[, ...])	Corrects a bias on the data
process_correct_noise_rhohv(procstatus, dscfg)	identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation
process_rhohv_rain(procstatus, dscfg[, ...])	Keeps only suitable data to evaluate the 80 percentile of RhoHV in rain
process_zdr_precip(procstatus, dscfg[, ...])	Keeps only suitable data to evaluate the differential reflectivity in moderate rain or precipitation (for vertical scans)
process_zdr_snow(procstatus, dscfg[, radar_list])	Keeps only suitable data to evaluate the differential reflectivity in snow
process_estimate_phidp0(procstatus, dscfg[, ...])	estimates the system differential phase offset at each ray
process_sun_hits(procstatus, dscfg[, radar_list])	monitoring of the radar using sun hits
process_selfconsistency_kdp_phidp(...[, ...])	Computes specific differential phase and differential phase in rain using the selfconsistency between Zdr, Zh and KDP

Continued on next page

Table 4 – continued from previous page

process_selfconsistency_bias(procstatus, dscfg)	Estimates the reflectivity bias by means of the selfconsistency algorithm by Gourley
process_time_avg_std(procstatus, dscfg[, . . .])	computes the average and standard deviation of data.
process_occurrence(procstatus, dscfg[, . . .])	computes the frequency of occurrence of data.
process_occurrence_period(procstatus, dscfg)	computes the frequency of occurrence over a long period of time by adding together shorter periods
process_monitoring(procstatus, dscfg[, . . .])	computes monitoring statistics
process_gc_monitoring(procstatus, dscfg[, . . .])	computes ground clutter monitoring statistics
process_time_avg(procstatus, dscfg[, radar_list])	computes the temporal mean of a field
process_weighted_time_avg(procstatus, dscfg)	computes the temporal mean of a field weighted by the reflectivity
process_time_avg_flag(procstatus, dscfg[, . . .])	computes a flag field describing the conditions of the data used while averaging
process_colocated_gates(procstatus, dscfg[, . . .])	Find colocated gates within two radars
process_intercomp(procstatus, dscfg[, . . .])	intercomparison between two radars
process_intercomp_time_avg(procstatus, dscfg)	intercomparison between the average reflectivity of two radars

2.5 Retrievals

process_signal_power(procstatus, dscfg[, . . .])	Computes the signal power in dBm
process_rcs(procstatus, dscfg[, radar_list])	Computes the radar cross-section (assuming a point target) from radar reflectivity.
process_rcs_pr(procstatus, dscfg[, radar_list])	Computes the radar cross-section (assuming a point target) from radar reflectivity by first computing the received power and then the RCS from it.
process_snr(procstatus, dscfg[, radar_list])	Computes SNR
process_l(procstatus, dscfg[, radar_list])	Computes L parameter
process_cdr(procstatus, dscfg[, radar_list])	Computes Circular Depolarization Ratio
process_rainrate(procstatus, dscfg[, radar_list])	Estimates rainfall rate from polarimetric moments
process_vol_refl(procstatus, dscfg[, radar_list])	Computes the volumetric reflectivity in 10log10(cm^2 km^-3)
process_bird_density(procstatus, dscfg[, . . .])	Computes the bird density from the volumetric reflectivity

2.6 Doppler processing

process_dealias_fourdd(procstatus, dscfg[, . . .])	Dealiases the Doppler velocity field using the 4DD technique from Curtis and Houze, 2001
process_dealias_region_based(procstatus, dscfg)	Dealiases the Doppler velocity field using a region based algorithm
process_dealias_unwrap_phase(procstatus, dscfg)	Dealiases the Doppler velocity field using multidimensional phase unwrapping
process_wind_vel(procstatus, dscfg[, radar_list])	Estimates the horizontal or vertical component of the wind from the radial velocity
process_windshear(procstatus, dscfg[, . . .])	Estimates the wind shear from the wind velocity

	Table 6 – continued from previous page
process_vad(procstatus, dscfg[, radar_list])	Estimates vertical wind profile using the VAD (velocity Azimuth Display) technique

2.7 Time series functions

process_point_measurement(procstatus, dscfg)	Obtains the radar data at a point location.
process_qvp(procstatus, dscfg[, radar_list])	Computes quasi vertical profiles, by averaging over height levels PPI data.
process_rqvp(procstatus, dscfg[, radar_list])	Computes range defined quasi vertical profiles, by averaging over height levels PPI data.
process_svp(procstatus, dscfg[, radar_list])	Computes slanted vertical profiles, by averaging over height levels PPI data.
process_evp(procstatus, dscfg[, radar_list])	Computes enhanced vertical profiles, by averaging over height levels PPI data.
process_time_height(procstatus, dscfg[, . . .])	Produces time height radar objects at a point of interest defined by latitude and longitude.

2.8 Trajectory functions

process_trajectory(procstatus, dscfg[, . . .])	Return trajectory
process_traj_atplane(procstatus, dscfg[, . . .])	Return time series according to trajectory
process_traj_antenna_pattern(procstatus, dscfg)	Process a new array of data volumes considering a plane trajectory.
process_traj_lightning(procstatus, dscfg[, . . .])	Return time series according to lightning trajectory
process_traj_trt(procstatus, dscfg[, . . .])	Processes data according to TRT trajectory

2.9 COSMO data

process_cosmo(procstatus, dscfg[, radar_list])	Gets COSMO data and put it in radar coordinates
process_cosmo_lookup_table(procstatus, dscfg)	Gets COSMO data and put it in radar coordinates using look up tables computed or loaded when initializing
process_cosmo_coord(procstatus, dscfg[, . . .])	Gets the COSMO indices corresponding to each cosmo coordinates
process_hzt(procstatus, dscfg[, radar_list])	Gets iso0 degree data in HZT format and put it in radar coordinates
process_hzt_lookup_table(procstatus, dscfg)	Gets HZT data and put it in radar coordinates using look up tables computed or loaded when initializing
process_hzt_coord(procstatus, dscfg[, . . .])	Gets the HZT indices corresponding to each HZT coordinates

pyrad.proc.**get_process_func**(*dataset_type*, *dsname*)

> Maps the dataset type into its processing function and data set format associated.

> > **Parameters**

dataset_type [str] The following is a list of data set types ordered by type of output dataset with the function they call. For details of what they do check the function documentation:

'VOL' format output: 'ATTENUATION': process_attenuation 'AZI_AVG': process_azimuthal_average 'BIAS_CORRECTION': process_correct_bias 'BIRDS_ID': process_birds_id 'BIRD_DENSITY': process_bird_density 'CDF': process_cdf 'CDR': process_cdr 'CLT_TO_SAN': process_clt_to_echo_id 'COSMO': process_cosmo 'COSMO_LOOKUP': process_cosmo_lookup_table 'DEALIAS_FOURDD': process_dealias_fourdd 'DEALIAS_REGION': process_dealias_region_based 'DEALIAS_UNWRAP': process_dealias_unwrap_phase 'ECHO_FILTER': process_echo_filter 'FIXED_RNG': process_fixed_rng 'HYDROCLASS': process_hydroclass 'HZT': process_hzt 'HZT_LOOKUP': process_hzt_lookup_table 'KDP_LEASTSQUARE_1W': process_kdp_leastsquare_single_window 'KDP_LEASTSQUARE_2W': process_kdp_leastsquare_double_window 'L': process_l 'NCVOL': process_save_radar 'OUTLIER_FILTER': process_outlier_filter 'PHIDP0_CORRECTION': process_correct_phidp0 'PHIDP0_ESTIMATE': process_estimate_phidp0 'PHIDP_KDP_KALMAN': process_phidp_kdp_Kalman 'PHIDP_KDP_LP': process_phidp_kdp_lp 'PHIDP_KDP_VULPIANI': process_phidp_kdp_Vulpiani 'PHIDP_SMOOTH_1W': process_smooth_phidp_single_window 'PHIDP_SMOOTH_2W': process_smooth_phidp_double_window 'PWR': process_signal_power 'RAINRATE': process_rainrate 'RAW': process_raw 'RCS': process_rcs 'RCS_PR': process_rcs_pr 'RHOHV_CORRECTION': process_correct_noise_rhohv 'RHOHV_RAIN': process_rhohv_rain 'ROI': process_roi 'SAN': process_echo_id 'SELFCONSISTENCY_BIAS': process_selfconsistency_bias 'SELFCONSISTENCY_KDP_PHIDP': process_selfconsistency_kdp_phidp 'SNR': process_snr 'SNR_FILTER': process_filter_snr 'TRAJ_TRT' : process_traj_trt 'VAD': process_vad 'VEL_FILTER': process_filter_vel_diff 'VIS_FILTER': process_filter_visibility 'VOL_REFL': process_vol_refl 'WIND_VEL': process_wind_vel 'WINDSHEAR': process_windshear 'ZDR_PREC': process_zdr_precip 'ZDR_SNOW': process_zdr_snow

'COLOCATED_GATES' format output: 'COLOCATED_GATES': process_colocated_gates

'COSMO_COORD' format output: 'COSMO_COORD': process_cosmo_coord 'HZT_COORD': process_hzt_coord

'GRID' format output: 'GRID': process_grid

'INTERCOMP' format output: 'INTERCOMP': process_intercomp 'INTERCOMP_TIME_AVG': process_intercomp_time_avg

'ML' format output: 'ML_DETECTION': process_melting_layer

'MONITORING' format output: 'GC_MONITORING': process_gc_monitoring 'MONITORING': process_monitoring

'OCCURRENCE' format output: 'OCCURRENCE': process_occurrence 'OCCURRENCE_PERIOD': process_occurrence_period 'TIMEAVG_STD': process_time_avg_std

'QVP' format output: 'EVP': process_evp 'QVP': process_qvp 'rQVP': process_rqvp 'SVP': process_svp 'TIME_HEIGHT': process_time_height

'SPARSE_GRID' format output: 'ZDR_COLUMN': process_zdr_column

'SUN_HITS' format output: 'SUN_HITS': process_sun_hits

'TIMEAVG' format output: 'FLAG_TIME_AVG':   process_time_avg_flag 'TIME_AVG':   process_time_avg   'WEIGHTED_TIME_AVG':   process_weighted_time_avg

'TIMESERIES' format output: 'POINT_MEASUREMENT':   'process_point_measurement'   'TRAJ_ANTENNA_PATTERN':   process_traj_antenna_pattern   'TRAJ_ATPLANE':   process_traj_atplane 'TRAJ_LIGHTNING': process_traj_lightning

'TRAJ_ONLY' format output: 'TRAJ': process_trajectory

    dsname [str] Name of dataset

Returns

    func_name [str or processing function] pyrad function used to process the data set type

    dsformat [str] data set format, i.e.: 'VOL', etc.

pyrad.proc.**process_attenuation**(*procstatus*, *dscfg*, *radar_list=None*)

Computes specific attenuation and specific differential attenuation using the Z-Phi method and corrects reflectivity and differential reflectivity

Parameters

    procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

    dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

        datatype [list of string. Dataset keyword] The input data types

        ATT_METHOD [float. Dataset keyword] The attenuation estimation method used. One of the following: ZPhi, Philin

        fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

    radar_list [list of Radar objects] Optional. list of radar objects

Returns

    new_dataset [dict] dictionary containing the output

    ind_rad [int] radar index

pyrad.proc.**process_azimuthal_average**(*procstatus*, *dscfg*, *radar_list=None*)

Averages radar data in azimuth obtaining and RHI as a result

Parameters

    procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

    dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

        datatype [string. Dataset keyword] The data type where we want to extract the point measurement

        gridconfig [dictionary. Dataset keyword] Dictionary containing some or all of this keywords: xmin, xmax, ymin, ymax, zmin, zmax : floats

            minimum and maximum horizontal distance from grid origin [km] and minimum and maximum vertical distance from grid origin [m] Defaults -40, 40, -40, 40, 0., 10000.

        hres, vres [floats] horizontal and vertical grid resolution [m] Defaults 1000., 500.

> **latorig, lonorig, altorig** [floats] latitude and longitude of grid origin [deg] and altitude
> of grid origin [m MSL] Defaults the latitude, longitude and altitude of the radar

> **wfunc** [str] the weighting function used to combine the radar gates close to a grid point.
> Possible values BARNES, CRESSMAN, NEAREST_NEIGHBOUR Default NEAR-
> EST_NEIGHBOUR

> **roif_func** [str] the function used to compute the region of interest. Possible values:
> dist_beam, constant

> **roi** [float] the (minimum) radius of the region of interest in m. Default half the largest
> resolution

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the gridded data

ind_rad [int] radar index

pyrad.proc.**process_bird_density**(*procstatus*, *dscfg*, *radar_list=None*)
    Computes the bird density from the volumetric reflectivity

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> **datatype** [list of string. Dataset keyword] The input data types

> **sigma_bird** [float. Dataset keyword] The bird radar cross section

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_birds_id**(*procstatus*, *dscfg*, *radar_list=None*)
    identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Birds

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> **datatype** [list of string. Dataset keyword] The input data types

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_cdf**(*procstatus*, *dscfg*, *radar_list=None*)
    Collects the fields necessary to compute the Cumulative Distribution Function

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_cdr**(*procstatus*, *dscfg*, *radar_list=None*)

Computes Circular Depolarization Ratio

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The input data type

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_clt_to_echo_id**(*procstatus*, *dscfg*, *radar_list=None*)

Converts clutter exit code from rad4alp into pyrad echo ID

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_colocated_gates**(*procstatus*, *dscfg*, *radar_list=None*)

Find colocated gates within two radars

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

h_tol [float. Dataset keyword] Tolerance in altitude difference between radar gates [m]. Default 100.

latlon_tol [float. Dataset keyword] Tolerance in latitude and longitude position between radar gates [deg]. Default 0.0005

vol_d_tol [float. Dataset keyword] Tolerance in pulse volume diameter [m]. Default 100.

vismin [float. Dataset keyword] Minimum visibility [percent]. Default None.

hmin [float. Dataset keyword] Minimum altitude [m MSL]. Default None.

hmax [float. Dataset keyword] Maximum altitude [m MSL]. Default None.

rmin [float. Dataset keyword] Minimum range [m]. Default None.

rmax [float. Dataset keyword] Maximum range [m]. Default None.

elmin [float. Dataset keyword] Minimum elevation angle [deg]. Default None.

elmax [float. Dataset keyword] Maximum elevation angle [deg]. Default None.

azrad1min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 1. Default None.

azrad1max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 1. Default None.

azrad2min [float. Dataset keyword] Minimum azimuth angle [deg] for radar 2. Default None.

azrad2max [float. Dataset keyword] Maximum azimuth angle [deg] for radar 2. Default None.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [radar object] radar object containing the flag field

ind_rad [int] radar index

pyrad.proc.**process_correct_bias**(*procstatus*, *dscfg*, *radar_list=None*)
Corrects a bias on the data

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type to correct for bias

bias [float. Dataset keyword] The bias to be corrected [dB]. Default 0

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_correct_noise_rhohv**(*procstatus*, *dscfg*, *radar_list=None*)
identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The data types used in the correction

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_correct_phidp0**(*procstatus*, *dscfg*, *radar_list=None*)
corrects phidp of the system phase

> **Parameters**
>
>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
>>
>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>>
>>> **datatype** [list of string. Dataset keyword] The input data types
>>>
>>> **rmin** [float. Dataset keyword] The minimum range where to look for valid data [m]
>>>
>>> **rmax** [float. Dataset keyword] The maximum range where to look for valid data [m]
>>>
>>> **rcell** [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]
>>>
>>> **Zmin** [float. Dataset keyword] The minimum reflectivity [dBZ]
>>>
>>> **Zmax** [float. Dataset keyword] The maximum reflectivity [dBZ]
>>
>> **radar_list** [list of Radar objects] Optional. list of radar objects

>
>> **new_dataset** [dict] dictionary containing the output
>>
>> **ind_rad** [int] radar index

pyrad.proc.**process_cosmo**(*procstatus*, *dscfg*, *radar_list=None*)
Gets COSMO data and put it in radar coordinates

> **Parameters**
>
>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
>>
>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>>
>>> **datatype** [string. Dataset keyword] arbitrary data type
>>>
>>> **keep_in_memory** [int. Dataset keyword] if set keeps the COSMO data dict, the COSMO coordinates dict and the COSMO field in radar coordinates in memory
>>>
>>> **regular_grid** [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and there is no need to compute a new COSMO field if the COSMO data has not changed
>>>
>>> **cosmo_type** [str. Dataset keyword] name of the COSMO field to process. Default TEMP
>>>
>>> **cosmo_variables** [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature
>>
>> **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
>> **new_dataset** [dict] dictionary containing the output
>>
>> **ind_rad** [int] radar index

pyrad.proc.**process_cosmo_coord**(*procstatus*, *dscfg*, *radar_list=None*)
Gets the COSMO indices corresponding to each cosmo coordinates

> **Parameters**
>
>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>
> > **datatype** [string. Dataset keyword] arbitrary data type
> >
> > **cosmopath** [string. General keyword] path where to store the look up table
>
> **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_cosmo_lookup_table**(*procstatus*, *dscfg*, *radar_list=None*)

> Gets COSMO data and put it in radar coordinates using look up tables computed or loaded when initializing

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] arbitrary data type
> > >
> > > **lookup_table** [int. Dataset keyword] if set a pre-computed look up table for the COSMO coordinates is loaded. Otherwise the look up table is computed taking the first radar object as reference
> > >
> > > **regular_grid** [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and therefore there is no need to interpolate the COSMO field in memory to the current radar grid
> > >
> > > **cosmo_type** [str. Dataset keyword] name of the COSMO field to process. Default TEMP
> > >
> > > **cosmo_variables** [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_dealias_fourdd**(*procstatus*, *dscfg*, *radar_list=None*)

> Dealiases the Doppler velocity field using the 4DD technique from Curtis and Houze, 2001

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The input data type
> > >
> > > **filt** [int. Dataset keyword] Flag controlling Bergen and Albers filter, 1 = yes, 0 = no.
> > >
> > > **sign** [int. Dataset keyword] Sign convention which the radial velocities in the volume created from the sounding data will will. This should match the convention used in the radar data. A value of 1 represents when positive values velocities are towards the radar, -1 represents when negative velocities are towards the radar.
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**

> **new_dataset** [dict] dictionary containing the output
>
> **ind_rad** [int] radar index

pyrad.proc.**process_dealias_region_based**(*procstatus*, *dscfg*, *radar_list=None*)

Dealiases the Doppler velocity field using a region based algorithm

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The input data type
> > >
> > > **interval_splits** [int, optional] Number of segments to split the nyquist interval into when finding regions of similar velocity. More splits creates a larger number of initial regions which takes longer to process but may result in better dealiasing. The default value of 3 seems to be a good compromise between performance and artifact free dealiasing. This value is not used if the interval_limits parameter is not None.
> > >
> > > **skip_between_rays, skip_along_ray** [int, optional] Maximum number of filtered gates to skip over when joining regions, gaps between region larger than this will not be connected. Parameters specify the maximum number of filtered gates between and along a ray. Set these parameters to 0 to disable unfolding across filtered gates.
> > >
> > > **centered** [bool, optional] True to apply centering to each sweep after the dealiasing algorithm so that the average number of unfolding is near 0. False does not apply centering which may results in individual sweeps under or over folded by the nyquist interval.
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_dealias_unwrap_phase**(*procstatus*, *dscfg*, *radar_list=None*)

Dealiases the Doppler velocity field using multi-dimensional phase unwrapping

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The input data type
> > >
> > > **unwrap_unit** [{'ray', 'sweep', 'volume'}, optional] Unit to unwrap independently. 'ray' will unwrap each ray individually, 'sweep' each sweep, and 'volume' will unwrap the entire volume in a single pass. 'sweep', the default, often gives superior results when the lower sweeps of the radar volume are contaminated by clutter. 'ray' does not use the gatefilter parameter and rays where gates ared masked will result in poor dealiasing for that ray.
> > >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_echo_filter**(*procstatus*, *dscfg*, *radar_list=None*)

Masks all echo types that are not of the class specified in keyword echo_type

>   **Parameters**

>   >   **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>   >   **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>   >   >   **datatype** [list of string. Dataset keyword] The input data types

>   >   >   **echo_type** [int] The type of echo to keep: 1 noise, 2 clutter, 3 precipitation. Default 3

>   >   **radar_list** [list of Radar objects] Optional. list of radar objects

>   **Returns**

>   >   **new_dataset** [dict] dictionary containing the output

>   >   **ind_rad** [int] radar index

pyrad.proc.**process_echo_id**(*procstatus*, *dscfg*, *radar_list=None*)
>   identifies echoes as 0: No data, 1: Noise, 2: Clutter, 3: Precipitation

>   **Parameters**

>   >   **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>   >   **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>   >   >   **datatype** [list of string. Dataset keyword] The input data types

>   **Returns**

>   >   **new_dataset** [dict] dictionary containing the output

>   >   **ind_rad** [int] radar index

pyrad.proc.**process_estimate_phidp0**(*procstatus*, *dscfg*, *radar_list=None*)
>   estimates the system differential phase offset at each ray

>   **Parameters**

>   >   **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>   >   **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>   >   >   **datatype** [list of string. Dataset keyword] The input data types

>   >   >   **rmin** [float. Dataset keyword] The minimum range where to look for valid data [m]

>   >   >   **rmax** [float. Dataset keyword] The maximum range where to look for valid data [m]

>   >   >   **rcell** [float. Dataset keyword] The length of a continuous cell to consider it valid precip [m]

>   >   >   **Zmin** [float. Dataset keyword] The minimum reflectivity [dBZ]

>   >   >   **Zmax** [float. Dataset keyword] The maximum reflectivity [dBZ]

>   >   **radar_list** [list of Radar objects] Optional. list of radar objects

>   **Returns**

>   >   **new_dataset** [dict] dictionary containing the output

>   >   **ind_rad** [int] radar index

pyrad.proc.**process_evp**(*procstatus*, *dscfg*, *radar_list=None*)
>   Computes enhanced vertical profiles, by averaging over height levels PPI data.

>   **Parameters**

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

lat, lon [float] latitude and longitude of the point of interest [deg]

latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005

delta_rng, delta_azi [float] maximum range distance [m] and azimuth distance [degree] from the central point of the evp containing data to average. Default 5000. and 10.

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 250.

avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"

nvalid_min [int] Minimum number of valid points to consider the data valid when performing the averaging. Default 1

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none'. 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the EVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

pyrad.proc.**process_filter_snr**(*procstatus*, *dscfg*, *radar_list=None*)
    filters out low SNR echoes

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

SNRmin [float. Dataset keyword] The minimum SNR to keep the data.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_filter_vel_diff**(*procstatus*, *dscfg*, *radar_list=None*)
    filters out range gates that could not be used for Doppler velocity estimation

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>
> > **datatype** [list of string. Dataset keyword] The input data types
> >
> > **SNRmin** [float. Dataset keyword] The minimum SNR to keep the data.
>
> **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_filter_visibility**(*procstatus*, *dscfg*, *radar_list=None*)

> filters out rays gates with low visibility and corrects the reflectivity

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [list of string. Dataset keyword] The input data types
> > >
> > > **VISmin** [float. Dataset keyword] The minimum visibility to keep the data.
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_fixed_rng**(*procstatus*, *dscfg*, *radar_list=None*)

> Obtains radar data at a fixed range

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [list of strings. Dataset keyword] The fields we want to extract
> > >
> > > **rng** [float. Dataset keyword] The fixed range [m]
> > >
> > > **RngTol** [float. Dataset keyword] The tolerance between the nominal range and the radar range
> > >
> > > **ele_min, ele_max, azi_min, azi_max** [floats. Dataset keyword] The azimuth and elevation limits of the data [deg]
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the data and metadata at the point of interest
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_gc_monitoring**(*procstatus*, *dscfg*, *radar_list=None*)

> computes ground clutter monitoring statistics

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>   **excessgatespath** [str. Config keyword] The path to the gates in excess of quantile location
>
>   **excessgates_fname** [str. Dataset keyword] The name of the gates in excess of quantile file
>
>   **datatype** [list of string. Dataset keyword] The input data types
>
>   **step** [float. Dataset keyword] The width of the histogram bin. Default is None. In that case the default step in function get_histogram_bins is used
>
>   **regular_grid** [Boolean. Dataset keyword] Whether the radar has a Boolean grid or not. Default False
>
>   **val_min** [Float. Dataset keyword] Minimum value to consider that the gate has signal. Default None
>
>   **filter_prec** [str. Dataset keyword] Give which type of volume should be filtered. None, no filtering; keep_wet, keep wet volumes; keep_dry, keep dry volumes.
>
>   **rmax_prec** [float. Dataset keyword] Maximum range to consider when looking for wet gates [m]
>
>   **percent_prec_max** [float. Dataset keyword] Maxim percentage of wet gates to consider the volume dry
>
> **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

> **new_dataset** [Radar] radar object containing histogram data
>
> **ind_rad** [int] radar index

pyrad.proc.**process_grid**(*procstatus*, *dscfg*, *radar_list=None*)
    Puts the radar data in a regular grid

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The data type where we want to extract the point measurement
> > >
> > > **gridconfig** [dictionary. Dataset keyword] Dictionary containing some or all of this keywords: xmin, xmax, ymin, ymax, zmin, zmax : floats
> > >
> > > > minimum and maximum horizontal distance from grid origin [km] and minimum and maximum vertical distance from grid origin [m] Defaults -40, 40, -40, 40, 0., 10000.
> > > >
> > > > **hres, vres** [floats] horizontal and vertical grid resolution [m] Defaults 1000., 500.
> > > >
> > > > **latorig, lonorig, altorig** [floats] latitude and longitude of grid origin [deg] and altitude of grid origin [m MSL] Defaults the latitude, longitude and altitude of the radar
> > >
> > > **wfunc** [str] the weighting function used to combine the radar gates close to a grid point. Possible values BARNES, CRESSMAN, NEAREST_NEIGHBOUR Default NEAREST_NEIGHBOUR
> > >
> > > **roif_func** [str] the function used to compute the region of interest. Possible values: dist_beam, constant
> > >
> > > **roi** [float] the (minimum) radius of the region of interest in m. Default half the largest resolution

> **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**

>> **new_dataset** [dict] dictionary containing the gridded data

>> **ind_rad** [int] radar index

pyrad.proc.**process_hydroclass**(*procstatus*, *dscfg*, *radar_list=None*)

> Classifies precipitation echoes

>> **Parameters**

>>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>>> **datatype** [list of string. Dataset keyword] The input data types

>>>> **HYDRO_METHOD** [string. Dataset keyword] The hydrometeor classification method. One of the following: SEMISUPERVISED

>>>> **RADARCENTROIDS** [string. Datset keyword] Used with HYDRO_METHOD SEMISUPERVISED. The name of the radar of which the derived centroids will be used. One of the following: A Albis, L Lema, P Plaine Morte, DX50

>>> **radar_list** [list of Radar objects] Optional. list of radar objects

>> **Returns**

>>> **new_dataset** [dict] dictionary containing the output

>>> **ind_rad** [int] radar index

pyrad.proc.**process_hzt**(*procstatus*, *dscfg*, *radar_list=None*)

> Gets iso0 degree data in HZT format and put it in radar coordinates

>> **Parameters**

>>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>>> **datatype** [string. Dataset keyword] arbitrary data type

>>>> **keep_in_memory** [int. Dataset keyword] if set keeps the COSMO data dict, the COSMO coordinates dict and the COSMO field in radar coordinates in memory

>>>> **regular_grid** [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and there is no need to compute a new COSMO field if the COSMO data has not changed

>>>> **cosmo_type** [str. Dataset keyword] name of the COSMO field to process. Default TEMP

>>>> **cosmo_variables** [list of strings. Dataset keyword] Py-art name of the COSMO fields. Default temperature

>>> **radar_list** [list of Radar objects] Optional. list of radar objects

>> **Returns**

>>> **new_dataset** [dict] dictionary containing the output

>>> **ind_rad** [int] radar index

pyrad.proc.**process_hzt_coord**(*procstatus*, *dscfg*, *radar_list=None*)

> Gets the HZT indices corresponding to each HZT coordinates

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] arbitrary data type
> > >
> > > **cosmopath** [string. General keyword] path where to store the look up table
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_hzt_lookup_table**(*procstatus*, *dscfg*, *radar_list=None*)
> Gets HZT data and put it in radar coordinates using look up tables computed or loaded when initializing
>
> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] arbitrary data type
> > >
> > > **lookup_table** [int. Dataset keyword] if set a pre-computed look up table for the COSMO coordinates is loaded. Otherwise the look up table is computed taking the first radar object as reference
> > >
> > > **regular_grid** [int. Dataset keyword] if set it is assume that the radar has a grid constant in time and therefore there is no need to interpolate the COSMO field in memory to the current radar grid
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_intercomp**(*procstatus*, *dscfg*, *radar_list=None*)
> intercomparison between two radars
>
> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> > >
> > > **coloc_data_dir** [string. Dataset keyword] name of the directory containing the csv file with colocated data
> > >
> > > **coloc_radars_name** [string. Dataset keyword] string identifying the radar names
> > >
> > > **azi_tol** [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg
> > >
> > > **ele_tol** [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5 deg
> > >
> > > **rng_tol** [float. Dataset keyword] range tolerance between the two radars. Default 50 m
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

>   **new_dataset** [dict] dictionary containing a dictionary with intercomparison data and the key
>   "final" which contains a boolean that is true when all volumes have been processed

>   **ind_rad** [int] radar index

pyrad.proc.**process_intercomp_time_avg**(*procstatus*, *dscfg*, *radar_list=None*)

>   intercomparison between the average reflectivity of two radars

>   **Parameters**

>>   **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>>   **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>>   **datatype** [list of string. Dataset keyword] The input data types

>>>   **coloc_data_dir** [string. Dataset keyword] name of the directory containing the csv file with
>>>   colocated data

>>>   **coloc_radars_name** [string. Dataset keyword] string identifying the radar names

>>>   **azi_tol** [float. Dataset keyword] azimuth tolerance between the two radars. Default 0.5 deg

>>>   **ele_tol** [float. Dataset keyword] elevation tolerance between the two radars. Default 0.5
>>>   deg

>>>   **rng_tol** [float. Dataset keyword] range tolerance between the two radars. Default 50 m

>>>   **clt_max** [int. Dataset keyword] maximum number of samples that can be clutter contami-
>>>   nated. Default 100 i.e. all

>>>   **phi_excess_max** [int. Dataset keyword] maximum number of samples that can have excess
>>>   instantaneous PhiDP. Default 100 i.e. all

>>>   **non_rain_max** [int. Dataset keyword] maximum number of samples that can be no rain.
>>>   Default 100 i.e. all

>>>   **phi_avg_max** [float. Dataset keyword] maximum average PhiDP allowed. Default 600 deg
>>>   i.e. any

>>   **radar_list** [list of Radar objects] Optional. list of radar objects

>   **Returns**

>>   **new_dataset** [dict] dictionary containing a dictionary with intercomparison data and the key
>>   "final" which contains a boolean that is true when all volumes have been processed

>>   **ind_rad** [int] radar index

pyrad.proc.**process_kdp_leastsquare_double_window**(*procstatus*, *dscfg*, *radar_list=None*)

>   Computes specific differential phase using a piecewise least square method

>   **Parameters**

>>   **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>>   **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>>   **datatype** [list of string. Dataset keyword] The input data types

>>>   **rwinds** [float. Dataset keyword] The length of the short segment for the least square method
>>>   [m]

>>>   **rwindl** [float. Dataset keyword] The length of the long segment for the least square method
>>>   [m]

> **Zthr** [float. Dataset keyword] The threshold defining which estimated data to use [dBZ]
>

> > > **threshold** [float. Dataset keyword] The distance between the value of the examined range gate and the median of the surrounding gates to consider the gate an outlier
> > >
> > > **nb** [int. Dataset keyword] The number of neighbours (to one side) to analyse. i.e. 2 would correspond to 24 gates
> > >
> > > **nb_min** [int. Dataset keyword] Minimum number of neighbouring gates to consider the examined gate valid
> > >
> > > **percentile_min, percentile_max** [float. Dataset keyword] gates below (above) these percentiles (computed over the sweep) are considered potential outliers and further examined
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_phidp_kdp_Kalman**(*procstatus*, *dscfg*, *radar_list=None*)

> Computes specific differential phase and differential phase using the Kalman filter as proposed by Schneebeli et al. The data is assumed to be clutter free and continous

> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [list of string. Dataset keyword] The input data types
> > >
> > > **parallel** [boolean. Dataset keyword] if set use parallel computing
> > >
> > > **get_phidp** [boolean. Datset keyword] if set the PhiDP computed by integrating the resultant KDP is added to the radar field
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

> **new_dataset** [dict] dictionary containing the output
>
> **ind_rad** [int] radar index

pyrad.proc.**process_phidp_kdp_Maesaka**(*procstatus*, *dscfg*, *radar_list=None*)
> Estimates PhiDP and KDP using the method by Maesaka. This method only retrieves data in rain (i.e. below the melting layer)

> **Parameters**
>
>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
>>
>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>>
>>> **datatype** [list of string. Dataset keyword] The input data types
>>>

> > > > **RngTol** [float. Dataset keyword] range tolerance to determine which radar bin to use [m]
> > >
> > > **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

> **new_dataset** [dict] dictionary containing the data and metadata at the point of interest
>
> **ind_rad** [int] radar index

pyrad.proc.**process_qvp**(*procstatus*, *dscfg*, *radar_list=None*)

> Computes quasi vertical profiles, by averaging over height levels PPI data.

> **Parameters**

> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The data type where we want to extract the point measurement
> > >
> > > **angle** [int or float] If the radar object contains a PPI volume, the sweep number to use, if it contains an RHI volume the elevation angle. Default 0.
> > >
> > > **ang_tol** [float] If the radar object contains an RHI volume, the tolerance in the elevation angle for the conversion into PPI
> > >
> > > **hmax** [float] The maximum height to plot [m]. Default 10000.
> > >
> > > **hres** [float] The height resolution [m]. Default 50
> > >
> > > **avg_type** [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"
> > >
> > > **nvalid_min** [int] Minimum number of valid points to accept average. Default 30.
> > >
> > > **interp_kind** [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**

> > **new_dataset** [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_rainrate**(*procstatus*, *dscfg*, *radar_list=None*)

> Estimates rainfall rate from polarimetric moments

> **Parameters**

> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [string. Dataset keyword] The input data type
> > >
> > > **RR_METHOD** [string. Dataset keyword] The rainfall rate estimation method. One of the following: Z, ZPoly, KDP, A, ZKDP, ZA, hydro
> > >
> > > **alpha, beta** [float] factor and exponent of the R-Var power law R = alpha*Var^Beta. Default value depending on RR_METHOD. Z (0.0376, 0.6112), KDP (None, None), A (None, None)

alphaz, betaz [float] factor and exponent of the R-Z power law R = alpha*Z^Beta. Default value (0.0376, 0.6112)

alphazr, betazr [float] factor and exponent of the R-Z power law R = alpha*Z^Beta applied to rain in method hydro. Default value (0.0376, 0.6112)

alphazs, betazs [float] factor and exponent of the R-Z power law R = alpha*Z^Beta applied to solid precipitation in method hydro. Default value (0.1, 0.5)

alphakdp, betakdp [float] factor and exponent of the R-KDP power law R = alpha*KDP^Beta. Default value (None, None)

alphaa, betaa [float] factor and exponent of the R-Ah power law R = alpha*Ah^Beta. Default value (None, None)

thresh [float] In hybrid methods, Rainfall rate threshold at which the retrieval method used changes [mm/h]. Default value depending on RR_METHOD. ZKDP 10, ZA 10, hydro 10

mp_factor [float] Factor by which the Z-R relation is multiplied in the melting layer in method hydro. Default 0.6

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_raw**(*procstatus*, *dscfg*, *radar_list=None*)
Dummy function that returns the initial input data set

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_rcs**(*procstatus*, *dscfg*, *radar_list=None*)
Computes the radar cross-section (assuming a point target) from radar reflectivity.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

kw2 [float. Dataset keyowrd] The water constant

pulse_width [float. Dataset keyowrd] The pulse width [s]

beamwidthv [float. Global keyword] The vertical polarization antenna beamwidth [deg]. Used if input is vertical reflectivity

beamwidthh [float. Global keyword] The horizontal polarization antenna beamwidth [deg]. Used if input is horizontal reflectivity

>
> **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

>
> **new_dataset** [dict] dictionary containing the output
>
> **ind_rad** [int] radar index

pyrad.proc.**process_rcs_pr**(*procstatus*, *dscfg*, *radar_list=None*)

> Computes the radar cross-section (assuming a point target) from radar reflectivity by first computing the received power and then the RCS from it.

Parameters

>
> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
>
> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
>
>> **datatype** [list of string. Dataset keyword] The input data types
>>
>> **antenna_gain** [float. Global keyword] The antenna gain [dB]
>>
>> **txpwrv** [float. Global keyword] The transmitted power of the vertical channel [dBm]. Used if input is vertical reflectivity
>>
>> **mflossv** [float. Global keyword] The matching filter losses of the vertical channel. Used if input is vertical reflectivity
>>
>> **radconstv** [float. Global keyword] The vertical channel radar constant. Used if input is vertical reflectivity
>>
>> **lrxv** [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is vertical reflectivity
>>
>> **ltxv** [float. Global keyword] The transmitter losses from the output of the high power amplifier to the antenna feed. [dB] positive value Used if input is vertical reflectivity
>>
>> **lradomev** [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is vertical reflectivity
>>
>> **txpwrh** [float. Global keyword] The transmitted power of the horizontal channel [dBm]. Used if input is horizontal reflectivity
>>
>> **mflossh** [float. Global keyword] The matching filter losses of the vertical channel. Used if input is horizontal reflectivity
>>
>> **radconsth** [float. Global keyword] The horizontal channel radar constant. Used if input is horizontal reflectivity

>> **lrxh** [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is horizontal reflectivity
>>
>> **ltxh** [float. Global keyword] The transmitter losses from the output of the high power amplifier to the antenna feed. [dB] positive value Used if input is horizontal reflectivity
>>
>> **lradomeh** [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is horizontal reflectivity
>>
>> **attg** [float. Dataset keyword] The gas attenuation
>
> **radar_list** [list of Radar objects] Optional. list of radar objects

Returns

>
> **new_dataset** [dict] dictionary containing the output
>
> **ind_rad** [int] radar index

`pyrad.proc.`**`process_rhohv_rain`**(*procstatus*, *dscfg*, *radar_list=None*)

    Keeps only suitable data to evaluate the 80 percentile of RhoHV in rain

        Parameters

            procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

            dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

                datatype [list of string. Dataset keyword] The input data types

                rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

                rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

                Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation [dBZ]. Default 20.

                Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipitation [dBZ] Default 40.

                ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default 700.

                fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

            radar_list [list of Radar objects] Optional. list of radar objects

        Returns

            new_dataset [dict] dictionary containing the output

            ind_rad [int] radar index

`pyrad.proc.`**`process_roi`**(*procstatus*, *dscfg*, *radar_list=None*)

    Obtains the radar data at a region of interest.

        Parameters

            procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

            dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

                datatype [string. Dataset keyword] The data type where we want to extract the point measurement

            radar_list [list of Radar objects] Optional. list of radar objects

        Returns

            new_dataset [dict] dictionary containing the data and metadata at the point of interest

            ind_rad [int] radar index

`pyrad.proc.`**`process_rqvp`**(*procstatus*, *dscfg*, *radar_list=None*)

    Computes range defined quasi vertical profiles, by averaging over height levels PPI data.

        Parameters

            procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

            dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

                datatype [string. Dataset keyword] The data type where we want to extract the point measurement

> > > **anglenr** [int] The sweep number to use. It assumes the radar volume consists on PPI scans
> > >
> > > **hmax** [float] The maximum height to plot [m]. Default 10000.
> > >
> > > **hres** [float] The height resolution [m]. Default 2.
> > >
> > > **avg_type** [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"
> > >
> > > **nvalid_min** [int] Minimum number of valid points to accept average. Default 30.
> > >
> > > **interp_kind** [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'nearest' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation
> > >
> > > **rmax** [float] ground range up to which the data is intended for use [m]. Default 50000.
> > >
> > > **weight_power** [float] Power p of the weighting function 1/abs(grng-(rmax-1))**p given to the data outside the desired range. -1 will set the weight to 0. Default 2.
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_save_radar**(*procstatus*, *dscfg*, *radar_list=None*)

> Dummy function that allows to save the entire radar object
>
> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> **Returns**
>
> > **new_dataset** [dict] dictionary containing the output
> >
> > **ind_rad** [int] radar index

pyrad.proc.**process_selfconsistency_bias**(*procstatus*, *dscfg*, *radar_list=None*)

> Estimates the reflectivity bias by means of the selfconsistency algorithm by Gourley
>
> **Parameters**
>
> > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> >
> > > **datatype** [list of string. Dataset keyword] The input data types
> > >
> > > **fzl** [float. Dataset keyword] Default freezing level height. Default 2000.
> > >
> > > **rsmooth** [float. Dataset keyword] length of the smoothing window [m]. Default 1000.
> > >
> > > **min_rhohv** [float. Dataset keyword] minimum valid RhoHV. Default 0.92
> > >
> > > **max_phidp** [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.

ml_thickness [float. Dataset keyword] Melting layer thickness [m]. Default 700.

rcell [float. Dataset keyword] length of continuous precipitation to consider the precipitation cell a valid phidp segment [m]. Default 1000.

dphidp_min [float. Dataset keyword] minimum phase shift [deg]. Default 2.

dphidp_max [float. Dataset keyword] maximum phase shift [deg]. Default 16.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_selfconsistency_kdp_phidp**(*procstatus*, *dscfg*, *radar_list=None*)

Computes specific differential phase and differential phase in rain using the selfconsistency between Zdr, Zh and KDP

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of strings. Dataset keyword] The input data types

rsmooth [float. Dataset keyword] length of the smoothing window [m]. Default 1000.

min_rhohv [float. Dataset keyword] minimum valid RhoHV. Default 0.92

max_phidp [float. Dataset keyword] maximum valid PhiDP [deg]. Default 20.

ml_thickness [float. Dataset keyword] assumed melting layer thickness [m]. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_signal_power**(*procstatus*, *dscfg*, *radar_list=None*)

Computes the signal power in dBm

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

mflossv [float. Global keyword] The matching filter losses of the vertical channel. Used if input is vertical reflectivity

radconstv [float. Global keyword] The vertical channel radar constant. Used if input is vertical reflectivity

lrxv [float. Global keyword] The receiver losses from the antenna feed to the reference point. [dB] positive value Used if input is vertical reflectivity

> > **lradomev** [float. Global keyword] The 1-way dry radome losses [dB] positive value. Used if input is vertical reflectivity
> >
> > **mflossh** [float. Global keyword] The matching filter losses of the vertical channel. Used if input is horizontal reflectivity
> >
> > **radconsth** [float. Global keyword] The horizontal channel radar constant. Used if input is horizontal reflectivity

> > > **datatype** [list of string. Dataset keyword] The input data types
> > >
> > > **rmin** [float. Dataset keyword] minimum range where to look for a sun hit signal [m]. Default 50000.
> > >
> > > **hmin** [float. Dataset keyword] minimum altitude where to look for a sun hit signal [m MSL]. Default 10000. The actual range from which a sun hit signal will be search will be the minimum between rmin and the range from which the altitude is higher than hmin.
> > >
> > > **delev_max** [float. Dataset keyword] maximum elevation distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5
> > >
> > > **dazim_max** [float. Dataset keyword] maximum azimuth distance from nominal radar elevation where to look for a sun hit signal [deg]. Default 1.5
> > >
> > > **elmin** [float. Dataset keyword] minimum radar elevation where to look for sun hits [deg]. Default 1.

nbins_min [int. Dataset keyword.] minimum number of range bins that have to contain signal to consider the ray a potential sun hit. Default 10.

attg [float. Dataset keyword] gaseous attenuation. Default None

max_std_pwr [float. Dataset keyword] maximum standard deviation of the signal power to consider the data a sun hit [dB]. Default 2.

max_std_zdr [float. Dataset keyword] maximum standard deviation of the ZDR to consider the data a sun hit [dB]. Default 2.

az_width_co [float. Dataset keyword] co-polar antenna azimuth width (convoluted with sun width) [deg]. Default None

el_width_co [float. Dataset keyword] co-polar antenna elevation width (convoluted with sun width) [deg]. Default None

az_width_cross [float. Dataset keyword] cross-polar antenna azimuth width (convoluted with sun width) [deg]. Default None

el_width_cross [float. Dataset keyword] cross-polar antenna elevation width (convoluted with sun width) [deg]. Default None

ndays [int. Dataset keyword] number of days used in sun retrieval. Default 1

coeff_band [float. Dataset keyword] multiplicate coefficient to transform pulse width into receiver bandwidth

radar_list [list of Radar objects] Optional. list of radar objects

Returns

sun_hits_dict [dict] dictionary containing a radar object, a sun_hits dict and a sun_retrieval dictionary

ind_rad [int] radar index

pyrad.proc.**process_svp**(*procstatus*, *dscfg*, *radar_list=None*)
    Computes slanted vertical profiles, by averaging over height levels PPI data.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [string. Dataset keyword] The data type where we want to extract the point measurement

angle [int or float] If the radar object contains a PPI volume, the sweep number to use, if it contains an RHI volume the elevation angle. Default 0.

ang_tol [float] If the radar object contains an RHI volume, the tolerance in the elevation angle for the conversion into PPI. Default 1.

lat, lon [float] latitude and longitude of the point of interest [deg]

latlon_tol [float] tolerance in latitude and longitude in deg. Default 0.0005

delta_rng, delta_azi [float] maximum range distance [m] and azimuth distance [degree] from the central point of the svp containing data to average. Default 5000. and 10.

hmax [float] The maximum height to plot [m]. Default 10000.

hres [float] The height resolution [m]. Default 250.

        avg_type [str] The type of averaging to perform. Can be either "mean" or "median" Default "mean"

        nvalid_min [int] Minimum number of valid points to consider the data valid when performing the averaging. Default 1

        interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

    radar_list [list of Radar objects] Optional. list of radar objects

   Returns

    new_dataset [dict] dictionary containing the svp and a keyboard stating whether the processing has finished or not.

    ind_rad [int] radar index

pyrad.proc.**process_time_avg**(*procstatus*, *dscfg*, *radar_list=None*)

   computes the temporal mean of a field

   Parameters

    procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

    dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

        datatype [list of string. Dataset keyword] The input data types

        period [float. Dataset keyword] the period to average [s]. Default 3600.

        start_average [float. Dataset keyword] when to start the average [s from midnight UTC]. Default 0.

        lin_trans: int. Dataset keyword If 1 apply linear transformation before averaging

    radar_list [list of Radar objects] Optional. list of radar objects

   Returns

    new_dataset [dict] dictionary containing the output

    ind_rad [int] radar index

pyrad.proc.**process_time_avg_flag**(*procstatus*, *dscfg*, *radar_list=None*)

   computes a flag field describing the conditions of the data used while averaging

   Parameters

    procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

    dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

        datatype [list of string. Dataset keyword] The input data types

        period [float. Dataset keyword] the period to average [s]. Default 3600.

        start_average [float. Dataset keyword] when to start the average [s from midnight UTC]. Default 0.

        phidpmax: float. Dataset keyword maximum PhiDP

    radar_list [list of Radar objects] Optional. list of radar objects

Returns

> **new_dataset** [Radar] radar object
>
> **ind_rad** [int] radar index

pyrad.proc.**process_time_avg_std**(*procstatus*, *dscfg*, *radar_list=None*)

> computes the average and standard deviation of data. It looks only for gates where data is present.

> **Parameters**

>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>> **datatype** [list of string. Dataset keyword] The input data types

>>> **regular_grid** [Boolean. Dataset keyword] Whether the radar has a Boolean grid or not. Default False

>>> **rmin, rmax** [float. Dataset keyword] minimum and maximum ranges where the computation takes place. If -1 the whole range is considered. Default is -1

>>> **val_min** [Float. Dataset keyword] Minimum reflectivity value to consider that the gate has signal. Default None

>>> **filter_prec** [str. Dataset keyword] Give which type of volume should be filtered. None, no filtering; keep_wet, keep wet volumes; keep_dry, keep dry volumes.

>>> **rmax_prec** [float. Dataset keyword] Maximum range to consider when looking for wet gates [m]

>>> **percent_prec_max** [float. Dataset keyword] Maxim percentage of wet gates to consider the volume dry

>>> **lin_trans** [Boolean. Dataset keyword] If True the data will be transformed into linear units. Default False

>> **radar_list** [list of Radar objects] Optional. list of radar objects

> **Returns**

>> **new_dataset** [dict] dictionary containing the output

>> **ind_rad** [int] radar index

pyrad.proc.**process_time_height**(*procstatus*, *dscfg*, *radar_list=None*)

> Produces time height radar objects at a point of interest defined by latitude and longitude. A time-height contains the evolution of the vertical structure of radar measurements above the location of interest.

> **Parameters**

>> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

>> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

>>> **datatype** [string. Dataset keyword] The data type where we want to extract the point measurement

>>> **lat, lon** [float] latitude and longitude of the point of interest [deg]

>>> **latlon_tol** [float] tolerance in latitude and longitude in deg. Default 0.0005

>>> **hmax** [float] The maximum height to plot [m]. Default 10000.

>>> **hres** [float] The height resolution [m]. Default 50

interp_kind [str] type of interpolation when projecting to vertical grid: 'none', or 'nearest', etc. Default 'none' 'none' will select from all data points within the regular grid height bin the closest to the center of the bin. 'nearest' will select the closest data point to the center of the height bin regardless if it is within the height bin or not. Data points can be masked values If another type of interpolation is selected masked values will be eliminated from the data points before the interpolation

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the QVP and a keyboard stating whether the processing has finished or not.

ind_rad [int] radar index

pyrad.proc.**process_traj_antenna_pattern**(*procstatus*, *dscfg*, *radar_list=None*, *trajectory=None*)

Process a new array of data volumes considering a plane trajectory. As result a timeseries with the values transposed for a given antenna pattern is created. The result is created when the LAST flag is set.

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries]

datatype [list of string. Dataset keyword] The input data types

antennaType [str. Dataset keyword] Type of antenna of the radar we want to get the view from. Can be AZIMUTH, ELEVATION, LOWBEAM, HIGHBEAM

par_azimuth_antenna [dict. Global ekyword] Dictionary containing the parameters of the PAR azimuth antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle

par_elevation_antenna [dict. Global keyword] Dictionary containing the parameters of the PAR elevation antenna, i.e. name of the file with the antenna azimuth pattern and fixed antenna angle

asr_lowbeam_antenna [dict. Global keyword] Dictionary containing the parameters of the ASR low beam antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle

asr_highbeam_antenna [dict. Global keyword] Dictionary containing the parameters of the ASR high beam antenna, i.e. name of the file with the antenna elevation pattern and fixed antenna angle

target_radar_pos [dict. Global keyword] Dictionary containing the latitude, longitude and altitude of the radar we want to get the view from. If not specifying it will assume the radar is collocated

range_all [Bool. Dataset keyword] If the real radar and the synthetic radar are co-located and this parameter is true the statistics are going to be computed using all the data from range 0 to the position of the plane. Default False

rhi_resolution [Bool. Dataset keyword] Resolution of the synthetic RHI used to compute the data as viewed from the synthetic radar [deg]. Default 0.5

max_altitude [float. Dataset keyword] Max altitude of the data to use when computing the view from the synthetic radar [m MSL]. Default 12000.

latlon_tol [float. Dataset keyword] The tolerance in latitude and longitude to determine which synthetic radar gates are co-located with real radar gates [deg]. Default 0.04

> **alt_tol** [float. Datset keyword] The tolerance in altitude to determine which synthetic radar gates are co-located with real radar gates [m]. Default 1000.
>
> **pattern_thres** [float. Dataset keyword] The minimum of the sum of the weights given to each value in order to consider the weighted quantile valid. It is related to the number of valid data points
>
> **data_is_log** [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True) or linear units (False). Default False
>
> **use_nans** [dict. Dataset keyword] Dictionary specyfing whether the nans have to be used in the computation of the statistics for each field. Default False
>
> **nan_value** [dict. Dataset keyword] Dictionary with the value to use to substitute the NaN values when computing the statistics of each field. Default 0

radar_list [list of Radar objects] Optional. list of radar objects

trajectory [Trajectory object] containing trajectory samples

Returns

trajectory [Trajectory object] Object holding time series

ind_rad [int] radar index

pyrad.proc.**process_traj_atplane**(*procstatus*, *dscfg*, *radar_list=None*, *trajectory=None*)
Return time series according to trajectory

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> **datatype** [list of string. Dataset keyword] The input data types
>
> **data_is_log** [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True) or linear units (False). Default False
>
> **ang_tol** [float. Dataset keyword] Factor that multiplies the angle resolution. Used when determining the neighbouring rays. Default 1.2

radar_list [list of Radar objects] Optional. list of radar objects

trajectory [Trajectory object] containing trajectory samples

Returns

trajectory [Trajectory object] Object holding time series

ind_rad [int] radar index

pyrad.proc.**process_traj_lightning**(*procstatus*, *dscfg*, *radar_list=None*, *trajectory=None*)
Return time series according to lightning trajectory

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> **datatype** [list of string. Dataset keyword] The input data types
>
> **data_is_log** [dict. Dataset keyword] Dictionary specifying for each field if it is in log (True) or linear units (False). Default False

> **ang_tol** [float. Dataset keyword] Factor that multiplies the angle resolution. Used when determining the neighbouring rays. Default 1.2

> **radar_list** [list of Radar objects] Optional. list of radar objects

> **trajectory** [Trajectory object] containing trajectory samples

Returns

> **trajectory** [Trajectory object] Object holding time series

> **ind_rad** [int] radar index

pyrad.proc.**process_traj_trt**(*procstatus*, *dscfg*, *radar_list=None*, *trajectory=None*)

> Processes data according to TRT trajectory

Parameters

> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> > **datatype** [list of string. Dataset keyword] The input data types

> > **time_tol** [float. Dataset keyword] tolerance between reference time of the radar volume and that of the TRT cell [s]. Default 100.

> > **alt_min, alt_max** [float. Dataset keyword] Minimum and maximum altitude of the data inside the TRT cell to retrieve [m MSL]. Default None

> **radar_list** [list of Radar objects] Optional. list of radar objects

> **trajectory** [Trajectory object] containing trajectory samples

Returns

> **trajectory** [Trajectory object] Object holding time series

> **ind_rad** [int] radar index

pyrad.proc.**process_trajectory**(*procstatus*, *dscfg*, *radar_list=None*, *trajectory=None*)

> Return trajectory

Parameters

> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> > **datatype** [list of string. Dataset keyword] The input data types

> **radar_list** [list of Radar objects] Optional. list of radar objects

> **trajectory** [Trajectory object] containing trajectory samples

Returns

> **new_dataset** [Trajectory object] radar object

> **ind_rad** [int] None

pyrad.proc.**process_vad**(*procstatus*, *dscfg*, *radar_list=None*)

> Estimates vertical wind profile using the VAD (velocity Azimuth Display) technique

Parameters

> **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

> **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

> > **datatype** [string. Dataset keyword] The input data type
> >
> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> > **Returns**
> >
> > > **new_dataset** [dict] dictionary containing the output
> > >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_vol_refl**(*procstatus*, *dscfg*, *radar_list=None*)

> Computes the volumetric reflectivity in 10log10(cm^2 km^-3)

> > **Parameters**
> >
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> > >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >
> > > > **datatype** [list of string. Dataset keyword] The input data types
> > > >
> > > > **freq** [float. Dataset keyword] The radar frequency
> > > >
> > > > **kw** [float. Dataset keyword] The water constant
> > >
> > > **radar_list** [list of Radar objects] Optional. list of radar objects
> >
> > **Returns**
> >
> > > **new_dataset** [dict] dictionary containing the output
> > >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_weighted_time_avg**(*procstatus*, *dscfg*, *radar_list=None*)

> computes the temporal mean of a field weighted by the reflectivity

> > **Parameters**
> >
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> > >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >
> > > > **datatype** [list of string. Dataset keyword] The input data types
> > > >
> > > > **period** [float. Dataset keyword] the period to average [s]. Default 3600.
> > > >
> > > > **start_average** [float. Dataset keyword] when to start the average [s from midnight UTC]. Default 0.
> > >
> > > **radar_list** [list of Radar objects] Optional. list of radar objects
> >
> > **Returns**
> >
> > > **new_dataset** [Radar] radar object
> > >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_wind_vel**(*procstatus*, *dscfg*, *radar_list=None*)

> Estimates the horizontal or vertical component of the wind from the radial velocity

> > **Parameters**
> >
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> > >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >
> > > > **datatype** [string. Dataset keyword] The input data type
> > > >
> > > > **vert_proj** [Boolean] If true the vertical projection is computed. Otherwise the horizontal projection is computed

> > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> > **Returns**
>
> > > **new_dataset** [dict] dictionary containing the output
> >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_windshear**(*procstatus*, *dscfg*, *radar_list=None*)
> Estimates the wind shear from the wind velocity

> > **Parameters**
>
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >

> > > >
> > > > **az_tol** [float] The tolerance in azimuth when looking for gates on top of the gate when computation is performed
> > >
> > > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> > **Returns**
>
> > > **new_dataset** [dict] dictionary containing the output
> >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_zdr_column**(*procstatus*, *dscfg*, *radar_list=None*)
> Detects ZDR columns

> > **Parameters**
>
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >
> > > > **datatype** [list of string. Dataset keyword] The input data types
> > >
> > > **radar_list** [list of Radar objects] Optional. list of radar objects
>
> > **Returns**
>
> > > **new_dataset** [dict] dictionary containing the output
> >
> > > **ind_rad** [int] radar index

pyrad.proc.**process_zdr_precip**(*procstatus*, *dscfg*, *radar_list=None*)
> Keeps only suitable data to evaluate the differential reflectivity in moderate rain or precipitation (for vertical scans)

> > **Parameters**
>
> > > **procstatus** [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing
> >
> > > **dscfg** [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:
> > >
> > > > **datatype** [list of string. Dataset keyword] The input data types
> > > >
> > > > **ml_filter** [boolean. Dataset keyword] indicates if a filter on data in and above the melting layer is applied. Default True.
> > > >
> > > > **rmin** [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.
> > > >
> > > > **rmax** [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as precipitation [dBZ]. Default 20.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as precipitation [dBZ] Default 22.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as precipitation Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as precipitation [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for precipitation [deg] Default None.

ml_thickness [float. Dataset keyword] assumed thickness of the melting layer. Default 700.

fzl [float. Dataset keyword] The default freezing level height. It will be used if no temperature field name is specified or the temperature field is not in the radar object. Default 2000.

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

pyrad.proc.**process_zdr_snow**(*procstatus*, *dscfg*, *radar_list=None*)

Keeps only suitable data to evaluate the differential reflectivity in snow

Parameters

procstatus [int] Processing status: 0 initializing, 1 processing volume, 2 post-processing

dscfg [dictionary of dictionaries] data set configuration. Accepted Configuration Keywords:

datatype [list of string. Dataset keyword] The input data types

rmin [float. Dataset keyword] minimum range where to look for rain [m]. Default 1000.

rmax [float. Dataset keyword] maximum range where to look for rain [m]. Default 50000.

Zmin [float. Dataset keyword] minimum reflectivity to consider the bin as snow [dBZ]. Default 0.

Zmax [float. Dataset keyword] maximum reflectivity to consider the bin as snow [dBZ] Default 30.

SNRmin [float. Dataset keyword] minimum SNR to consider the bin as snow [dB]. Default 10.

SNRmax [float. Dataset keyword] maximum SNR to consider the bin as snow [dB] Default 50.

RhoHVmin [float. Dataset keyword] minimum RhoHV to consider the bin as snow Default 0.97

PhiDPmax [float. Dataset keyword] maximum PhiDP to consider the bin as snow [deg] Default 10.

elmax [float. Dataset keyword] maximum elevation angle where to look for snow [deg] Default None.

KDPmax [float. Dataset keyword] maximum KDP to consider the bin as snow [deg] Default None

TEMPmin [float. Dataset keyword] minimum temperature to consider the bin as snow [deg C]. Default None

TEMPmax [float. Dataset keyword] maximum temperature to consider the bin as snow [deg C] Default None

hydroclass [list of ints. Dataset keyword] list of hydrometeor classes to keep for the analysis Default [2] (dry snow)

radar_list [list of Radar objects] Optional. list of radar objects

Returns

new_dataset [dict] dictionary containing the output

ind_rad [int] radar index

PRODUCTS GENERATION (`PYRAD.PROD`)

Initiate the products generation.

3.1 Auxiliary functions

get_dsformat_func	

3.2 Product generation

generate_occurrence_products(dataset, prdcfg)	generates occurrence products. Accepted product types:
generate_cosmo_coord_products(dataset, prdcfg)	generates COSMO coordinates products. Accepted product types:
generate_sun_hits_products(dataset, prdcfg)	generates sun hits products. Accepted product types:
generate_intercomp_products(dataset, prdcfg)	Generates radar intercomparison products. Accepted product types:
generate_colocated_gates_products(dataset, . . .)	Generates colocated gates products. Accepted product types:
generate_time_avg_products(dataset, prdcfg)	generates time average products. Accepted product types:
generate_qvp_products(dataset, prdcfg)	Generates quasi vertical profile-like products.
generate_vol_products(dataset, prdcfg)	Generates radar volume products. Accepted product types:
generate_timeseries_products(dataset, prdcfg)	Generates time series products. Accepted product types:
generate_monitoring_products(dataset, prdcfg)	generates a monitoring product.
generate_grid_products(dataset, prdcfg)	generates grid products. Accepted product types:
generate_traj_product(traj, prdcfg)	Generates trajectory products. Accepted product types:
generate_ml_products(dataset, prdcfg)	Generates melting layer products. Accepted product types:

pyrad.prod.**generate_colocated_gates_products**(*dataset*, *prdcfg*)

> **Generates colocated gates products. Accepted product types:**
>
> > **'WRITE_COLOCATED_GATES': Writes the position of the co-located gates** in a csv file

All the products of the 'VOL' dataset group

> **Parameters**
>
> > **dataset** [tuple] radar objects and colocated gates dictionary
> >
> > **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries
>
> **Returns**
>
> > **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_cosmo_coord_products**(*dataset*, *prdcfg*)

> **generates COSMO coordinates products. Accepted product types:**
>
> > **'SAVEVOL': Save an object containing the index of the COSMO model grid** that corresponds to each radar gate in a C/F radial file.
>
> > **Parameters**
> >
> > > **dataset** [tuple] radar object containing the COSMO coordinates
> > >

> > > > **level: int** The altitude level to plot. The rest of the parameters are defined by the parameters in 'ppiImageConfig' and 'ppiMapImageConfig' in the 'loc' configuration file
>
> > **Parameters**
> >
> > > **dataset** [grid] grid object

> **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries

> Returns

> > None or name of generated files

pyrad.prod.**generate_intercomp_products**(*dataset*, *prdcfg*)

> **Generates radar intercomparison products. Accepted product types:**

> > **'PLOT_AND_WRITE_INTERCOMP_TS': Writes statistics of radar** intercomparison in a file and plots the time series of the statistics. User defined parameters:

> > > **'add_date_in_fname': Bool** If true adds the year in the csv file containing the statistics. Default False

> > > **'sort_by_date': Bool** If true sorts the statistics by date when reading the csv file containing the statistics. Default False

> > > **'rewrite': Bool** If true rewrites the csv file containing the statistics. Default False

> > > **'npoints_min': int** The minimum number of points to consider the statistics valid and therefore use the data point in the plotting. Default 0

> > > **'corr_min': float** The minimum correlation to consider the statistics valid and therefore use the data point in the plotting. Default 0.

> > **'PLOT_SCATTER_INTERCOMP': Plots a density plot with the points of** radar 1 versus the points of radar 2 User defined parameters:

> > > **'step': float** The quantization step of the data. If none it will be computed using the Py-ART config file. Default None

> > **'WRITE_INTERCOMP': Writes the instantaneously intercompared data** (gate positions, values, etc.) in a csv file.

> > **'WRITE_INTERCOMP_TIME_AVG': Writes the time-averaged intercompared** data (gate positions, values, etc.) in a csv file.

> Parameters

> > **dataset** [tuple] values of colocated gates dictionary

> > **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries

> Returns

> > **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_ml_products**(*dataset*, *prdcfg*)

> **Generates melting layer products. Accepted product types:**

> > **'ML_TS': Plots and writes a time series of the melting layer, i.e.** the evolution of the average and standard deviation of the melting layer top and thickness and the the number of rays used in the retrieval. User defined parameters:

> > > **dpi: int** The pixel density of the plot. Default 72

> > **'SAVE_ML': Saves an object containing the melting layer retrieval** information in a C/F radial file

> > All the products of the 'VOL' dataset group

> Parameters

---

dataset [dict] dictionary containing the radar object and a keyword stating the status of the processing

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

filename [str] the name of the file created. None otherwise

pyrad.prod.**generate_monitoring_products**(*dataset*, *prdcfg*)

generates a monitoring product. With the parameter 'hist_type' the user may define is the product is computed for each radar volume ('instant') or at the end of the processing period ('cumulative'). Default is 'cumulative'. Accepted product types:

'ANGULAR_DENSITY': For a specified elevation angle, plots a 2D histogram with the azimuth angle in the X-axis and the data values in the Y-axis. The reference values and the user defined quantiles are also plot on the same figure User defined parameters:

anglenr: int The elevation angle number to plot

quantiles: list of floats The quantiles to plot. Default 25., 50., 75.

ref_value: float The reference value

vmin, vmax [floats or None] The minimum and maximum values of the data points. If not specified they are obtained from the Py-ART config file

'CUMUL_VOL_TS': Plots time series of the average of instantaneous quantiles stored in a csv file. User defined parameters:

quantiles: list of 3 floats the quantiles to compute. Default 25., 50., 75.

ref_value: float The reference value. Default 0

sort_by_date: Bool If true when reading the csv file containing the statistics the data is sorted by date. Default False

rewrite: Bool If true the csv file containing the statistics is rewritten

add_data_in_fname: Bool If true and the data used is cumulative the year is written in the csv file name and the plot file name

npoints_min: int Minimum number of points to use the data point in the plotting and to send an alarm. Default 0

vmin, vmax: float or None Limits of the Y-axis (data value). If None the limits are obtained from the Py-ART config file

alarm: Bool If true an alarm is sent

tol_abs: float Margin of tolerance from the reference value. If the current value is above this margin an alarm is sent. If the margin is not specified it is not possible to send any alarm

tol_trend: float Margin of tolerance from the reference value. If the trend of the last X events is above this margin an alarm is sent. If the margin is not specified it is not possible to send any alarm

nevents_min: int Minimum number of events with sufficient points to send an alarm related to the trend. If not specified it is not possible to send any alarm

sender: str The mail of the alarm sender. If not specified it is not possible to send any alarm

receiver_list: list of str The list of emails of the people that will receive the alarm.. If not specified it is not possible to send any alarm

'PPI_HISTOGRAM': Plots a histogram of data at a particular elevation angle. User defined parameters:

anglenr: int The elevation angle number to plot

'SAVEVOL': Saves the monitoring data in a C/F radar file. The data field contains histograms of data for each pair of azimuth and elevation angles

'VOL_HISTOGRAM': Plots a histogram of data collected from all the radar volume. User defined parameters:

write_data: bool If true the resultant histogram is also saved in a csv file. Default True.

'VOL_TS': Computes statistics of the gathered data and writes them in a csv file and plots a time series of those statistics. User defined parameters:

quantiles: list of 3 floats the quantiles to compute. Default 25., 50., 75.

ref_value: float The reference value. Default 0

sort_by_date: Bool If true when reading the csv file containing the statistics the data is sorted by date. Default False

rewrite: Bool If true the csv file containing the statistics is rewritten

add_data_in_fname: Bool If true and the data used is cumulative the year is written in the csv file name and the plot file name

npoints_min: int Minimum number of points to use the data point in the plotting and to send an alarm. Default 0

vmin, vmax: float or None Limits of the Y-axis (data value). If None the limits are obtained from the Py-ART config file

alarm: Bool If true an alarm is sent

tol_abs: float Margin of tolerance from the reference value. If the current value is above this margin an alarm is sent. If the margin is not specified it is not possible to send any alarm

tol_trend: float Margin of tolerance from the reference value. If the trend of the last X events is above this margin an alarm is sent. If the margin is not specified it is not possible to send any alarm

nevents_min: int Minimum number of events with sufficient points to send an alarm related to the trend. If not specified it is not possible to send any alarm

sender: str The mail of the alarm sender. If not specified it is not possible to send any alarm

receiver_list: list of str The list of emails of the people that will receive the alarm.. If not specified it is not possible to send any alarm

Parameters

dataset [dictionary] dictionary containing a histogram object and some metadata

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

> **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_occurrence_products**(*dataset*, *prdcfg*)

> **generates occurrence products. Accepted product types:**
>
> > **'WRITE_EXCESS_GATES': Write the data that identifies radar gates** with clutter that has a frequency of occurrence above a certain threshold. User defined parameters:
> >
> > > **quant_min: float** Minimum frequency of occurrence in percentage to keep the gate as valid. Default 95.
> >
> > All the products of the 'VOL' dataset group
>
> **Parameters**
>
> > **dataset** [tuple] radar object and metadata dictionary
> >
> > **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries
>
> **Returns**
>
> > **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_qvp_products**(*dataset*, *prdcfg*)

> Generates quasi vertical profile-like products. Quasi vertical profiles come from azimuthal averaging of polarimetric radar data. With the variable 'qvp_type' the user decides if the product has to be generated at the end of the processing period ('final') or instantaneously ('instant') Accepted product types:
>
> > All the products of the 'VOL' dataset group
>
> **Parameters**
>
> > **dataset** [dict] dictionary containing the radar object and a keyword stating the status of the processing
> >
> > **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries
>
> **Returns**
>
> > **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_sun_hits_products**(*dataset*, *prdcfg*)

> **generates sun hits products. Accepted product types:**
>
> > **'PLOT_SUN_HITS': Plots in a sun-radar azimuth difference-sun-radar** elevation difference grid the values of all sun hits obtained during the processing period
> >
> > **'PLOT_SUN_RETRIEVAL': Plots in a sun-radar azimuth difference-sun-** radar elevation difference grid the retrieved sun pattern
> >
> > **'PLOT_SUN_RETRIEVAL_TS': Plots time series of the retrieved sun** pattern parameters User defined parameters:
> >
> > > **dpi: int** The pixel density of the plot. Default 72
> > >
> > > **add_date_in_fname: Bool** If true the year is added in the plot file name
> >
> > **'WRITE_SUN_HITS': Writes the information concerning possible sun hits** in a csv file
> >
> > **'WRITE_SUN_RETRIEVAL': Writes the retrieved sun pattern parameters in** a csv file. User defined parameters:
> >
> > > **add_date_in_fname: Bool** If true the year is added in the csv file name

---

All the products of the 'VOL' dataset group

Parameters

> **dataset** [tuple] radar object and sun hits dictionary
>
> **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

> **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_time_avg_products**(*dataset*, *prdcfg*)

> **generates time average products. Accepted product types:** All the products of the 'VOL' dataset group
>
> **Parameters**
>
> > **dataset** [tuple] radar objects and colocated gates dictionary
> >
> > **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries
>
> **Returns**
>
> > **filename** [str] the name of the file created. None otherwise

pyrad.prod.**generate_timeseries_products**(*dataset*, *prdcfg*)

> **Generates time series products. Accepted product types:**
>
> **'COMPARE_CUMULATIVE_POINT': Plots in the same graph 2 time series of** data accumulation (tipically rainfall rate). One time series is a point measurement of radar data while the other is from a co-located instrument (rain gauge or disdrometer) User defined parameters:
>
> > **dpi: int** The pixel density of the plot. Default 72
> >
> > **vmin, vmax: float** The limits of the Y-axis. If none they will be obtained from the Py-ART config file.
> >
> > **sensor: str** The sensor type. Can be 'rgage' or 'disdro'
> >
> > **sensorid: str** The sensor ID.
> >
> > **location: str** A string identifying the location of the disdrometer
> >
> > **freq: float** The frequency used to retrieve the polarimetric variables of a disdrometer
> >
> > **ele: float** The elevation angle used to retrieve the polarimetric variables of a disdrometer
> >
> > **ScanPeriod: float** The scaning period of the radar in seconds. This parameter is defined in the 'loc' config file
>
> **'COMPARE_POINT': Plots in the same graph 2 time series of** data . One time series is a point measurement of radar data while the other is from a co-located instrument (rain gauge or disdrometer) User defined parameters:
>
> > **dpi: int** The pixel density of the plot. Default 72
> >
> > **vmin, vmax: float** The limits of the Y-axis. If none they will be obtained from the Py-ART config file.
> >
> > **sensor: str** The sensor type. Can be 'rgage' or 'disdro'
> >
> > **sensorid: str** The sensor ID.
> >
> > **location: str** A string identifying the location of the disdrometer

> **freq: float** The frequency used to retrieve the polarimetric variables of a disdrometer
>
> **ele: float** The elevation angle used to retrieve the polarimetric variables of a disdrometer

'COMPARE_TIME_AVG': Creates a scatter plot of average radar data versus average sensor data. User defined parameters:

> **dpi: int** The pixel density of the plot. Default 72
>
> **sensor: str** The sensor type. Can be 'rgage' or 'disdro'
>
> **sensorid: str** The sensor ID.
>
> **location: str** A string identifying the location of the disdrometer
>
> **freq: float** The frequency used to retrieve the polarimetric variables of a disdrometer
>
> **ele: float** The elevation angle used to retrieve the polarimetric variables of a disdrometer
>
> **cum_time: float** Data accumulation time [s]. Default 3600.
>
> **base_time: float** Starting moment of the accumulation [s from midnight]. Default 0.

'PLOT_AND_WRITE': Writes and plots a trajectory time series.

> **User defined parameters:**
>
> > **ymin, ymax: float** The minimum and maximum value of the Y-axis. If none it will be obtained from the Py-ART config file.

'PLOT_AND_WRITE_POINT': Plots and writes a time series of radar data at a particular point User defined parameters:

> **dpi: int** The pixel density of the plot. Default 72
>
> **vmin, vmax: float** The limits of the Y-axis. If none they will be obtained from the Py-ART config file.

'PLOT_CUMULATIVE_POINT': Plots a time series of radar data accumulation at a particular point. User defined parameters:

> **dpi: int** The pixel density of the plot. Default 72
>
> **vmin, vmax: float** The limits of the Y-axis. If none they will be obtained from the Py-ART config file.
>
> **ScanPeriod: float** The scaning period of the radar in seconds. This parameter is defined in the 'loc' config file

'PLOT_HIST': plots and writes a histogram of all the data gathered during the trajectory processing User defined parameters:

> **step: float or None** The quantization step of the data. If None it will be obtained from the Py-ART config file

'TRAJ_CAPPI_IMAGE': Creates a CAPPI image with the trajectory position overplot on it. User defined parameters:

> **color_ref: str** The meaning of the color code with which the trajectory is plotted. Can be 'None', 'altitude' (the absolute altitude), 'rel_altitude' (altitude relative to the CAPPI altitude), 'time' (trajectory time respect of the start of the radar scan leading to the CAPPI)
>
> **altitude: float** The CAPPI altitude [m]
>
> **wfunc: str** Function used in the gridding of the radar data. The function types are defined in pyart.map.grid_from_radars. Default 'NEAREST_NEIGHBOUR'

> **res: float** The CAPPI resolution [m]. Default 500.

> **Parameters**

>> **dataset** [dictionary] radar object

>> **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries

> **Returns**

>> **no return**

pyrad.prod.**generate_traj_product**(*traj*, *prdcfg*)

> **Generates trajectory products. Accepted product types:**

>> **'TRAJ_MAP': Plots the trajectory on a lat-lon map with the altitude** color coded

>> **'TRAJ_PLOT': Plots time series of the trajectory respect to the radar** elevation, azimuth or range
>> User defined parameters:

>>> **'datatype': str** The type of parameter: 'EL', 'AZ', or 'RANGE'

>> 'TRAJ_TEXT': Writes the trajectory information in a csv file

> **Parameters**

>> **traj** [Trajectory object]

>> **prdcfg** [dictionary of dictionaries] product configuration dictionary of dictionaries

> **Returns**

>> **None**

pyrad.prod.**generate_vol_products**(*dataset*, *prdcfg*)

> **Generates radar volume products. Accepted product types:**

>> **'CDF': plots and writes the cumulative density function of data**

>> **User defined parameters:**

>>> **quantiles: list of floats** The quantiles to compute in percent. Default None

>>> **sector: dict** dictionary defining the sector where to compute the CDF. Default is None and the CDF is computed over all the data May contain:

>>>> **rmin, rmax: float** min and max range [m]

>>>> **azmin, azmax: float** min and max azimuth angle [deg]

>>>> **elmin, elmax: float** min and max elevation angle [deg]

>>>> **hmin, hmax: float** min and max altitude [m MSL]

>>> **vismin: float** The minimum visibility to use the data. Default None

>>> **absolute: Bool** If true the absolute values of the data will be used. Default False

>>> **use_nans: Bool** If true NaN values will be used. Default False

>>> **nan_value: Bool** The value by which the NaNs are substituted if NaN values are to be used in the computation

>>> **filterclt: Bool** If True the gates containing clutter are filtered

> **filterprec: list of ints** The hydrometeor types that are filtered from the analysis. Default empty list.

'BSCOPE_IMAGE': Creates a B-scope image (azimuth, range)

> **User defined parameters:**
>
> > **anglenr** [int] The elevation angle number to use

'CAPPI_IMAGE': Creates a CAPPI image

> **User defined parameters:**
>
> > **altitude: flt** CAPPI altitude [m MSL]
> >
> > **wfunc: str** The function used to produce the CAPPI as defined in pyart.map.grid_from_radars. Default 'NEAREST_NEIGHBOUR'
> >
> > **cappi_res: float** The CAPPI resolution [m]. Default 500.

'FIELD_COVERAGE': Gets the field coverage over a certain sector

> **User defined parameters:**
>
> > **threshold: float or None** Minimum value to consider the data valid. Default None
> >
> > **nvalid_min: float** Minimum number of valid gates in the ray to consider it valid. Default 5
> >
> > **ele_res, azi_res: float** Elevation and azimuth resolution of the sectors [deg]. Default 1. and 2.
> >
> > **ele_min, ele_max: float** Min and max elevation angle defining the sector [deg]. Default 0. and 30.
> >
> > **ele_step: float** Elevation step [deg]. Default 5.
> >
> > **ele_sect_start, ele_sect_stop: float or None** start and stop angles of the sector coverage. Default None
> >
> > **quantiles: list of floats** The quantiles to compute in the sector. Default 10. to 90. by steps of 10.
> >
> > **AngTol: float** The tolerance in elevation angle when putting the data in a fixed grid

'FIXED_RNG_IMAGE': Plots a fixed range image

> **User defined parameters:**
>
> > **AngTol** [float] The tolerance between the nominal angles and the actual radar angles. Default 1.
> >
> > **ele_res, azi_res: float or None** The resolution of the fixed grid [deg]. If None it will be obtained from the separation between angles

'HISTOGRAM': Computes a histogram of the radar volum data

> **User defined parameters:**
>
> > **step: float or None** the data quantization step. If none it will be obtained from the Py-ART configuration file
> >
> > **write_data: Bool** If true the histogram data is written in a csv file

'PLOT_ALONG_COORD': Plots the radar volume data along a particular coordinate User defined parameters:

> > **colors: list of str or None** The colors of each ploted line
> >
> > **mode: str** Ploting mode. Can be 'ALONG_RNG', 'ALONG_AZI' or 'ALONG_ELE'

value_start, value_stop: float The starting and ending points of the data to plot. According to the mode it may refer to the range, azimuth or elevation. If not specified the minimum and maximum possible values are used

fix_elevations, fix_azimuths, fix_ranges: list of floats The elevations, azimuths or ranges to plot for each mode. 'ALONG_RNG' would use fix_elevations and fix_azimuths 'ALONG_AZI' fix_ranges and fix_elevations 'ALONG_ELE' fix_ranges and fix_azimuths

AngTol: float The tolerance to match the radar angle to the fixed angles Default 1.

RngTol: float The tolerance to match the radar range to the fixed ranges Default 50.

'PPI_CONTOUR': Plots a PPI countour plot

> **User defined parameters:**
>
> > **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
> >
> > **anglenr: float** The elevation angle number

'PPI_CONTOUR_OVERPLOT': Plots a PPI of a field with another field overplotted as a contour plot. User defined parameters:

> **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
>
> **anglenr: float** The elevation angle number

'PPI_IMAGE': Plots a PPI image. It can also plot the histogram and the quantiles of the data in the PPI. User defined parameters:

> **anglenr: float** The elevation angle number
>
> **plot_type: str** The type of plot to perform. Can be 'PPI', 'QUANTILES' or 'HISTOGRAM'
>
> **step: float or None** If the plot type is 'HISTOGRAM', the width of the histogram bin. If None it will be obtained from the Py-ART config file
>
> **quantiles: list of float or None** If the plot type is 'QUANTILES', the list of quantiles to compute. If None a default list of quantiles will be computed

'PPI_MAP': Plots a PPI image over a map. The map resolution and the type of maps used are defined in the variables 'mapres' and 'maps' in 'ppiMapImageConfig' in the loc config file. User defined parameters:

> **anglenr: float** The elevation angle number

'PROFILE_STATS': Computes and plots a vertical profile statistics. The statistics are saved in a csv file User defined parameters:

> **heightResolution: float** The height resolution of the profile [m]. Default 100.
>
> **heightMin, heightMax: float or None** The minimum and maximum altitude of the profile [m MSL]. If None the values will be obtained from the minimum and maximum gate altitude.

> **quantity: str** The type of statistics to plot. Can be 'quantiles', 'mode', 'reqgression_mean' or 'mean'.
>
> **quantiles: list of floats** If quantity type is 'quantiles' the list of quantiles to compute. Default 25., 50., 75.
>
> **nvalid_min: int** The minimum number of valid points to consider the statistic valid. Default 4
>
> **make_linear: Bool** If true the data is converted from log to linear before computing the stats
>
> **include_nans: Bool** If true NaN values are included in the statistics
>
> **fixed_span: Bool** If true the profile plot has a fix X-axis
>
> **vmin, vmax: float or None** If fixed_span is set, the minimum and maximum values of the X-axis. If None, they are obtained from the Py-ART config file

'PSEUDOPPI_CONTOUR': Plots a pseudo-PPI countour plot

> **User defined parameters:**
>
> > **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
> >
> > **angle: float** The elevation angle at which compute the PPI
> >
> > **EleTol: float** The tolerance between the actual radar elevation angle and the nominal pseudo-PPI elevation angle.

'PSEUDOPPI_CONTOUR_OVERPLOT': Plots a pseudo-PPI of a field with another field overplotted as a contour plot User defined parameters:

> **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
>
> **angle: float** The elevation angle at which compute the PPI
>
> **EleTol: float** The tolerance between the actual radar elevation angle and the nominal pseudo-PPI elevation angle.

'PSEUDOPPI_IMAGE': Plots a pseudo-PPI image. It can also plot the histogram and the quantiles of the data in the pseudo-PPI. User defined parameters:

> **angle: float** The elevation angle of the pseudo-PPI
>
> **EleTol: float** The tolerance between the actual radar elevation angle and the nominal pseudo-PPI elevation angle.
>
> **plot_type: str** The type of plot to perform. Can be 'PPI', 'QUANTILES' or 'HISTOGRAM'
>
> **step: float or None** If the plot type is 'HISTOGRAM', the width of the histogram bin. If None it will be obtained from the Py-ART config file
>
> **quantiles: list of float or None** If the plot type is 'QUANTILES', the list of quantiles to compute. If None a default list of quantiles will be computed

'PSEUDOPPI_MAP': Plots a pseudo-PPI image over a map. The map resolution and the type of maps used are defined in the variables 'mapres' and 'maps' in 'ppiMapImageConfig' in the loc config file. User defined parameters:

> **angle: float** The elevation angle of the pseudo-PPI
>
> **EleTol: float** The tolerance between the actual radar elevation angle and the nominal pseudo-PPI elevation angle.

'PSEUDORHI_CONTOUR': Plots a pseudo-RHI countour plot

User defined parameters:

> **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
>
> **angle: float** The azimuth angle at which to compute the RPI
>
> **AziTol: float** The tolerance between the actual radar azimuth angle and the nominal pseudo-RHI azimuth angle.

'PSEUDORHI_CONTOUR_OVERPLOT': Plots a pseudo-RHI of a field with another field overplotted as a contour plot User defined parameters:

> **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.
>
> **angle: float** The azimuth angle at which to compute the RPI
>
> **AziTol: float** The tolerance between the actual radar azimuth angle and the nominal pseudo-RHI azimuth angle.

'PSEUDORHI_IMAGE': Plots a pseudo-RHI image. It can also plot the histogram and the quantiles of the data in the pseudo-RHI. User defined parameters:

> **angle: float** The azimuth angle at which to compute the RPI
>
> **AziTol: float** The tolerance between the actual radar azimuth angle and the nominal pseudo-RHI azimuth angle.
>
> **plot_type: str** The type of plot to perform. Can be 'RHI', 'QUANTILES' or 'HISTOGRAM'
>
> **step: float or None** If the plot type is 'HISTOGRAM', the width of the histogram bin. If None it will be obtained from the Py-ART config file
>
> **quantiles: list of float or None** If the plot type is 'QUANTILES', the list of quantiles to compute. If None a default list of quantiles will be computed

'QUANTILES': Plots and writes the quantiles of a radar volume

User defined parameters:

> **quantiles: list of floats or None** the list of quantiles to compute. If None a default list of quantiles will be computed.
>
> **write_data: Bool** If True the computed data will be also written in a csv file
>
> **fixed_span: Bool** If true the quantile plot has a fix Y-axis

> > **vmin, vmax: float or None** If fixed_span is set, the minimum and maximum values of the Y-axis. If None, they are obtained from the Py-ART config file

> **'RHI_CONTOUR': Plots an RHI countour plot**

> > **User defined parameters:**

> > > **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.

> > > **anglenr: int** The azimuth angle number

> **'RHI_CONTOUR_OVERPLOT': Plots an RHI of a field with another field** over-plotted as a contour plot User defined parameters:

> > **contour_values: list of floats or None** The list of contour values to plot. If None the contour values are going to be obtained from the Py-ART config file either with the dictionary key 'contour_values' or from the minimum and maximum values of the field with an assumed division of 10 levels.

> > **anglenr: int** The azimuth angle number

> **'RHI_IMAGE': Plots an RHI image. It can also plot the** histogram and the quantiles of the data in the RHI. User defined parameters:

> > **anglenr: int** The azimuth angle number

> > **plot_type: str** The type of plot to perform. Can be 'RHI', 'QUANTILES' or 'HISTOGRAM'

> > **step: float or None** If the plot type is 'HISTOGRAM', the width of the histogram bin. If None it will be obtained from the Py-ART config file

> > **quantiles: list of float or None** If the plot type is 'QUANTILES', the list of quantiles to compute. If None a default list of quantiles will be computed

> **'RHI_PROFILE': Computes and plots a vertical profile statistics out of** an RHI. The statistics are saved in a csv file User defined parameters:

> > **rangeStart, rangeStop: float** The range start and stop of the data to extract from the RHI to compute the statistics [m]. Default 0., 25000.

> > **heightResolution: float** The height resolution of the profile [m]. Default 100.

> > **heightMin, heightMax: float or None** The minimum and maximum altitude of the profile [m MSL]. If None the values will be obtained from the minimum and maximum gate altitude.

> > **quantity: str** The type of statistics to plot. Can be 'quantiles', 'mode', 'reqgression_mean' or 'mean'.

> > **quantiles: list of floats** If quantity type is 'quantiles' the list of quantiles to compute. Default 25., 50., 75.

> > **nvalid_min: int** The minimum number of valid points to consider the statistic valid. Default 4

> > **make_linear: Bool** If true the data is converted from log to linear before computing the stats

> > **include_nans: Bool** If true NaN values are included in the statistics

> > **fixed_span: Bool** If true the profile plot has a fix X-axis

---

> > **vmin, vmax: float or None** If fixed_span is set, the minimum and maximum values of the X-axis. If None, they are obtained from the Py-ART config file

> **'SAVEALL': Saves radar volume data including all or a list of user-** defined fields in a C/F radial or ODIM file User defined parameters:

> > **file_type: str** The type of file used to save the data. Can be 'nc' or 'h5'. Default 'nc'

> > **datatypes: list of str or None** The list of data types to save. If it is None, all fields in the radar object will be saved

> > **physical: Bool** If True the data will be saved in physical units (floats). Otherwise it will be quantized and saved as binary

> > **compression: str** For ODIM file formats, the type of compression. Can be any of the allowed compression types for hdf5 files. Default gzip

> > **compression_opts: any** The compression options allowed by the hdf5. Depends on the type of compression. Default 6 (The gzip compression level).

> **'SAVESTATE': Saves the last processed data in a file. Used for real-** time data processing

> **'SAVEVOL': Saves one field of a radar volume data in a C/F radial or** ODIM file User defined parameters:

> > **file_type: str** The type of file used to save the data. Can be 'nc' or 'h5'. Default 'nc'

> > **physical: Bool** If True the data will be saved in physical units (floats). Otherwise it will be quantized and saved as binary

> > **compression: str** For ODIM file formats, the type of compression. Can be any of the allowed compression types for hdf5 files. Default gzip

> > **compression_opts: any** The compression options allowed by the hdf5. Depends on the type of compression. Default 6 (The gzip compression level).

> **'TIME_RANGE': Plots a time-range plot**

> > **User defined parameters:**

> > **anglenr: float** The number of the fixed angle to plot

> **'WIND_PROFILE': Plots vertical profile of wind data (U, V, W** components and wind velocity and direction) out of a radar volume containing the retrieved U,V and W components of the wind, the standard deviation of the retrieval and the velocity difference between the estimated radial velocity (assuming the wind to be uniform) and the actual measured radial velocity. User defined parameters:

> > **heightResolution: float** The height resolution of the profile [m]. Default 100.

> > **heightMin, heightMax: float or None** The minimum and maximum altitude of the profile [m MSL]. If None the values will be obtained from the minimum and maximum gate altitude.

> > **min_ele: float** The minimum elevation to be used in the computation of the vertical velocities. Default 5.

> > **max_ele: float** The maximum elevation to be used in the computation of the horizontal velocities. Default 85.

> > **fixed_span: Bool** If true the profile plot has a fix X-axis

> > **vmin, vmax: float or None** If fixed_span is set, the minimum and maximum values of the X-axis. If None, they are obtained from the span of the U component defined in the Py-ART config file

Parameters

dataset [dict] dictionary with key radar_out containing a radar object

prdcfg [dictionary of dictionaries] product configuration dictionary of dictionaries

Returns

The list of created fields or None

pyrad.prod.**get_prodgen_func**(*dsformat*, *dsname*, *dstype*)
maps the dataset format into its processing function

Parameters

dsformat [str] dataset group. The following is a list of dataset groups with the function that is called to generate their products. For details about what the functions do check the function documentation:

'VOL': generate_vol_products 'COLOCATED_GATES': generate_colocated_gates_products 'COSMO_COORD': generate_cosmo_coord_products 'GRID': generate_grid_products 'INTERCOMP': generate_intercomp_products 'ML': generate_ml_products 'MONITORING': generate_monitoring_products 'OCCURRENCE': generate_occurrence_products 'QVP': generate_qvp_products 'SPARSE_GRID': generate_sparse_grid_products 'SUN_HITS': generate_sun_hits_products 'TIMEAVG': generate_time_avg_products 'TIMESERIES': generate_timeseries_products 'TRAJ_ONLY': generate_traj_product

Returns

func [function] pyrad function used to generate the products

INPUT AND OUTPUT (`PYRAD.IO`)

Functions to read and write data and configuration files.

4.1 Reading configuration files

read_config(fname[, cfg])	Read a pyrad config file.

4.2 Reading radar data

get_data(voltime, datatypesdescr, cfg)	Reads pyrad input data.

4.3 Reading cosmo data

cosmo2radar_data(radar, cosmo_coord, cosmo_data)	get the COSMO value corresponding to each radar gate using nearest neighbour interpolation
cosmo2radar_coord(radar, cosmo_coord[, . . .])	Given the radar coordinates find the nearest COSMO model pixel
hzt2radar_data(radar, hzt_coord, hzt_data[, . . .])	get the HZT value corresponding to each radar gate using nearest neighbour interpolation
hzt2radar_coord(radar, hzt_coord[, . . .])	Given the radar coordinates find the nearest HZT pixel
get_cosmo_fields(cosmo_data, cosmo_ind[, . . .])	Get the COSMO data corresponding to each radar gate using a precomputed look up table of the nearest neighbour
get_iso0_field(hzt_data, hzt_ind, z_radar[, . . .])	Get the height over iso0 data corresponding to each radar gate using a precomputed look up table of the nearest neighbour
read_cosmo_data(fname[, field_names, celsius])	Reads COSMO data from a netcdf file
read_cosmo_coord(fname[, zmin])	Reads COSMO coordinates from a netcdf file
read_hzt_data(fname[, chy0, chx0])	Reads iso-0 degree data from an HZT file

4.4 Reading other data

read_last_state(fname)	Reads a file containing the date of acquisition of the last volume processed
read_status(voltime, cfg[, ind_rad])	Reads rad4alp xml status file.
read_rad4alp_cosmo(fname, datatype[, ngates])	Reads rad4alp COSMO data binary file.
read_rad4alp_vis(fname, datatype)	Reads rad4alp visibility data binary file.
read_excess_gates(fname)	Reads a csv files containing the position of gates exceeding a given percentile of frequency of occurrence
read_colocated_gates(fname)	Reads a csv files containing the position of colocated gates
read_colocated_data(fname)	Reads a csv files containing colocated data
read_timeseries(fname)	Reads a time series contained in a csv file
read_ts_cum(fname)	Reads a time series of precipitation accumulation contained in a csv file
read_monitoring_ts(fname[, sort_by_date])	Reads a monitoring time series contained in a csv file
read_intercomp_scores_ts(fname[, sort_by_date])	Reads a radar intercomparison scores csv file
get_sensor_data(date, datatype, cfg)	Gets data from a point measurement sensor (rain gauge or disdrometer)
read_smn(fname)	Reads SwissMetNet data contained in a csv file
read_smn2(fname)	Reads SwissMetNet data contained in a csv file with format station,time,value
read_disdro_scattering(fname)	Reads scattering parameters computed from disdrometer data contained in a text file
read_sun_hits(fname)	Reads sun hits data contained in a csv file
read_sun_hits_multiple_days(cfg, time_ref[, . . .])	Reads sun hits data from multiple file sources
read_sun_retrieval(fname)	Reads sun retrieval data contained in a csv file
read_solar_flux(fname)	Reads solar flux data from the DRAO observatory in Canada
read_selfconsistency(fname)	Reads a self-consistency table with Zdr, Kdp/Zh columns
read_antenna_pattern(fname[, linear, twoway])	Read antenna pattern from file
read_meteorage(fname)	Reads METEORAGE lightning data contained in a text file.
read_lightning(fname[, filter_data])	Reads lightning data contained in a text file.
read_lightning_traj(fname)	Reads lightning trajectory data contained in a csv file.
read_lightning_all(fname[, labels])	Reads a file containing lightning data and co-located polarimetric data.
read_trt_scores(fname)	Reads the TRT scores contained in a text file.
read_trt_data(fname)	Reads the TRT data contained in a text file.
read_trt_traj_data(fname)	Reads the TRT cell data contained in a text file.
read_trt_cell_lightning(fname)	Reads the lightning data of a TRT cell.
read_rhi_profile(fname[, labels])	Reads a monitoring time series contained in a csv file
read_histogram(fname)	Reads a histogram contained in a csv file
read_quantiles(fname)	Reads quantiles contained in a csv file
read_profile_ts(fname_list, labels[, hres, . . .])	Reads a colection of profile data file and creates a time series
read_histogram_ts(fname_list, datatype[, t_res])	Reads a colection of histogram data file and creates a time series
read_quantiles_ts(fname_list[, step, qmin, . . .])	Reads a colection of quantiles data file and creates a time series

Continued on next page

Table 4 – continued from previous page	
read_ml_ts(fname)	Reads a melting layer time series contained in a csv file

4.5 Writing data

write_ts_lightning(flashnr, time_data, ...)	writes the LMA sources data and the value of the colocated polarimetric variables
send_msg(sender, receiver_list, subject, fname)	sends the content of a text file by email
write_alarm_msg(radar_name, param_name_unit, ...)	writes an alarm file
write_last_state(datetime_last, fname)	writes SwissMetNet data in format datetime,avg_value, std_value
write_smn(datetime_vec, value_avg_vec, ...)	writes SwissMetNet data in format datetime,avg_value, std_value
write_trt_cell_data(traj_ID, yyyymmd-dHHMM, ...)	writes TRT cell data
write_trt_cell_scores(traj_ID, ...)	writes TRT cells scores
write_trt_cell_lightning(cell_ID, cell_time, ...)	writes the lightning data for each TRT cell
write_rhi_profile(hvec, data, nvalid_vec, ...)	writes the values of an RHI profile in a text file
write_field_coverage(quantiles, values, ...)	writes the quantiles of the coverage on a particular sector
write_cdf(quantiles, values, ntot, nnan, ...)	writes a cumulative distribution function
write_histogram(bin_edges, values, fname[, ...])	writes a histogram
write_quantiles(quantiles, values, fname[, ...])	writes quantiles
write_ts_polar_data(dataset, fname)	writes time series of data
write_ts_cum(dataset, fname)	writes time series accumulation of data
write_monitoring_ts(start_time, np_t, ...[, ...])	writes time series of data
write_excess_gates(excess_dict, fname)	Writes the position and values of gates that have a frequency of occurrence higher than a particular threshold
write_intercomp_scores_ts(start_time, stats, ...)	writes time series of radar intercomparison scores
write_colocated_gates(coloc_gates, fname)	Writes the position of gates colocated with two radars
write_colocated_data(coloc_data, fname)	Writes the data of gates colocated with two radars
write_colocated_data_time_avg(coloc_data, fname)	Writes the time averaged data of gates colocated with two radars
write_sun_hits(sun_hits, fname)	Writes sun hits data.
write_sun_retrieval(sun_retrieval, fname)	Writes sun retrieval data.

4.6 Auxiliary functions

map_hydro(hydro_data_op)	maps the operational hydrometeor classification identifiers to the ones used by Py-ART
map_Doppler(Doppler_data_bin, Nyquist_vel)	maps the binary METRANET Doppler data to actual Doppler velocity
get_save_dir(basepath, procname, dsname, prd-name)	obtains the path to a product directory and eventually creates it

Table 6 – continued from previous page

make_filename(prdtype, dstype, dsname, ext_list)	creates a product file name
generate_field_name_str(datatype)	Generates a field name in a nice to read format.
get_fieldname_pyart(datatype)	maps the config file radar data type name into the corresponding rainbow Py-ART field name
get_fieldname_cosmo(field_name)	maps the Py-ART field name into the corresponding COSMO variable name
get_field_unit(datatype)	Return unit of datatype.
get_file_list(datadescriptor, starttime, . . .)	gets the list of files with a time period
get_trtfile_list(datapath, starttime, endtime)	gets the list of TRT files with a time period
get_new_rainbow_file_name(master_fname, . . .)	get the rainbow file name containing datatype from a master file name and data type
get_datatype_fields(datadescriptor)	splits the data type descriptor and provides each individual member
get_dataset_fields(datasetdescr)	splits the dataset type descriptor and provides each individual member
get_datetime(fname, datadescriptor)	Given a data descriptor gets date and time from file name
find_raw_cosmo_file(voltime, datatype, cfg)	Search a COSMO file in netcdf format
find_hzt_file(voltime, cfg[, ind_rad])	Search an ISO-0 degree file in HZT format
_get_datetime(fname, datagroup[, ftime_format])	Given a data group gets date and time from file name

4.7 Trajectory

Trajectory(filename[, starttime, endtime, . . .])	A class for reading and handling trajectory data from a file.

4.8 TimeSeries

TimeSeries(desc[, timevec, timeformat, . . .])	Holding timeseries data and metadata.

class pyrad.io.**TimeSeries**(*desc*, *timevec=None*, *timeformat=None*, *maxlength=None*, *datatype=''*)
    Bases: object

    Holding timeseries data and metadata.

        Attributes

            description [array of str] Description of the data of the time series.

            time_vector [array of datetime objects]

            timeformat [how to print the time (default:] 'Date, UTC [seconds since midnight]'

            dataseries [List of _dataSeries object holding the] data

Methods

add_dataseries(label, unit_name, unit[, . . .])	Add a new data series to the timeseries object.
add_timesample(dt, values)	Add a new sample to the time series.

Continued on next page

Table 9 – continued from previous page

plot(fname[, ymin, ymax])	Make a figure of a time series
plot_hist(fname[, step])	Make histograms of time series
write(fname)	Write time series output

__class__
    alias of `builtins.type`

__delattr__(*$self*, *name*, */*)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.io.timeseries', '__doc__': "\n Holding

__dir__(*$self*, */*)
    Default dir() implementation.

__eq__(*$self*, *value*, */*)
    Return self==value.

__format__(*$self*, *format_spec*, */*)
    Default object formatter.

__ge__(*$self*, *value*, */*)
    Return self>=value.

__getattribute__(*$self*, *name*, */*)
    Return getattr(self, name).

__gt__(*$self*, *value*, */*)
    Return self>value.

__hash__(*$self*, */*)
    Return hash(self).

__init__(*desc*, *timevec=None*, *timeformat=None*, *maxlength=None*, *datatype=''*)
    Initalize the object.

> **Parameters**
>
> > **desc** [array of str]
> >
> > **timevec** [array of datetime]
> >
> > **timeformat** [specifies time format]
> >
> > **maxlength** [Maximal length of the time series]
> >
> > **num_el** [Number of values in the time series]

__init_subclass__()
    This method is called when a class is subclassed.

    The default implementation does nothing. It may be overridden to extend subclasses.

__le__(*$self*, *value*, */*)
    Return self<=value.

__lt__(*$self*, *value*, */*)
    Return self<value.

__module__ = 'pyrad.io.timeseries'

__ne__(*$self*, *value*, */*)
    Return self!=value.

__new__(*$type*, **args*, ***kwargs*)
    Create and return a new object. See help(type) for accurate signature.

__reduce__(*$self*, */*)
    Helper for pickle.

__reduce_ex__(*$self*, *protocol*, */*)
    Helper for pickle.

__repr__(*$self*, */*)
    Return repr(self).

__setattr__(*$self*, *name*, *value*, */*)
    Implement setattr(self, name, value).

__sizeof__(*$self*, */*)
    Size of object in memory, in bytes.

__str__(*$self*, */*)
    Return str(self).

__subclasshook__()
    Abstract classes can override this to customize issubclass().

    This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImplemented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal algorithm (and the outcome is cached).

__weakref__
    list of weak references to the object (if defined)

add_dataseries(*label*, *unit_name*, *unit*, *dataseries=None*, *plot=True*, *color=None*, *linestyle=None*)
    Add a new data series to the timeseries object. The length of the data vector must be the same as the length of the time vector.

add_timesample(*dt*, *values*)
    Add a new sample to the time series.

plot(*fname*, *ymin=None*, *ymax=None*)
    Make a figure of a time series

plot_hist(*fname*, *step=None*)
    Make histograms of time series

write(*fname*)
    Write time series output

class pyrad.io.**Trajectory**(*filename*, *starttime=None*, *endtime=None*, *trajtype='plane'*, *flashnr=0*)
    Bases: `object`

    A class for reading and handling trajectory data from a file.

        Attributes

            filename [str] Path and name of the trajectory definition file

            starttime [datetime] Start time of trajectory processing.

            endtime [datetime] End time of trajectory processing.

            trajtype [str]

            Type of trajectory. Can be 'plane' or 'lightning'

            time_vector [Array of datetime objects] Array containing the trajectory time samples

wgs84_lat_deg [Array of floats] WGS84 latitude samples in radian

wgs84_lon_deg [Array of floats] WGS84 longitude samples in radian

wgs84_alt_m [Array of floats] WGS84 altitude samples in m

nsamples [int]

Number of samples in the trajectory

_swiss_grid_done [Bool] Indicates that convertion to Swiss coordinates has been performed

swiss_chy, swiss_chx, swiss_chh [Array of floats] Swiss coordinates in m

radar_list [list] List of radars for which trajectories are going to be computed

flashnr [int] For 'lightning' only. Number of flash for which trajectory data is going to be computed. If 0 all all flashes are going to be considered.

time_in_flash [array of floats] For 'lightning' only. Time within flash (sec)

flashnr_vec [array of ints] For 'lightning' only. Flash number of each data sample

dBm [array of floats] For 'lightning' only. Lightning power (dBm)

Methods

add_radar(radar)	Add the coordinates (WGS84 longitude, latitude and non WGS84 altitude) of a radar to the radar_list.
calculate_velocities(radar)	Calculate velocities.
get_end_time()	Get time of last trajectory sample.
get_samples_in_period([start, end])	"
get_start_time()	Get time of first trajectory sample.

__class__
    alias of `builtins.type`

__delattr__(*$self, name, /*)
    Implement delattr(self, name).

__dict__ = mappingproxy({'__module__': 'pyrad.io.trajectory', '__doc__': "\n A class

__dir__(*$self, /*)
    Default dir() implementation.

__eq__(*$self, value, /*)
    Return self==value.

__format__(*$self, format_spec, /*)
    Default object formatter.

__ge__(*$self, value, /*)
    Return self>=value.

__getattribute__(*$self, name, /*)
    Return getattr(self, name).

__gt__(*$self, value, /*)
    Return self>value.

__hash__ (*$self*, */*)
> Return hash(self).

__init__ (*filename*, *starttime=None*, *endtime=None*, *trajtype='plane'*, *flashnr=0*)
> Initalize the object.

> > **Parameters**

> > > **filename** [str] Filename containing the trajectory samples.

> > > **starttime** [datetime] Start time of trajectory processing. If not given, use the time of the first trajectory sample.

> > > **endtime** [datetime] End time of trajectory processing. If not given, use the time of the last trajectory sample.

> > > **trajtype** [str] type of trajectory. Can be plane or lightning

> > > **flashnr** [int] If type of trajectory is lightning, the flash number to check the trajectory. 0 means all flash numbers included

__init_subclass__ ()
> This method is called when a class is subclassed.

> The default implementation does nothing. It may be overridden to extend subclasses.

__le__ (*$self*, *value*, */*)
> Return self<=value.

__lt__ (*$self*, *value*, */*)
> Return self<value.

__module__ = **'pyrad.io.trajectory'**

__ne__ (*$self*, *value*, */*)
> Return self!=value.

__new__ (*$type*, **args*, ***kwargs*)
> Create and return a new object. See help(type) for accurate signature.

__reduce__ (*$self*, */*)
> Helper for pickle.

__reduce_ex__ (*$self*, *protocol*, */*)
> Helper for pickle.

__repr__ (*$self*, */*)
> Return repr(self).

__setattr__ (*$self*, *name*, *value*, */*)
> Implement setattr(self, name, value).

__sizeof__ (*$self*, */*)
> Size of object in memory, in bytes.

__str__ (*$self*, */*)
> Return str(self).

__subclasshook__ ()
> Abstract classes can override this to customize issubclass().

> This is invoked early on by abc.ABCMeta.__subclasscheck__(). It should return True, False or NotImplemented. If it returns NotImplemented, the normal algorithm is used. Otherwise, it overrides the normal algorithm (and the outcome is cached).

__weakref__
    list of weak references to the object (if defined)

_convert_traj_to_swissgrid()
    Convert trajectory samples from WGS84 to Swiss CH1903 coordinates

_get_total_seconds(*x*)
    Return total seconds of timedelta object

_read_traj()
    Read trajectory from file

_read_traj_lightning(*flashnr=0*)
    Read trajectory from lightning file

        Parameters

            flashnr [int] the flash number to keep. If 0 data from all flashes will be kept

_read_traj_trt()
    Read trajectory from TRT file

add_radar(*radar*)
    Add the coordinates (WGS84 longitude, latitude and non WGS84 altitude) of a radar to the radar_list.

        Parameters

            radar [pyart radar object] containing the radar coordinates

calculate_velocities(*radar*)
    Calculate velocities.

get_end_time()
    Get time of last trajectory sample.

get_samples_in_period(*start=None*, *end=None*)
    " Get indices of samples of the trajectory within given time period.

get_start_time()
    Get time of first trajectory sample.

pyrad.io.**add_field**(*radar_dest*, *radar_orig*)
    adds the fields from orig radar into dest radar. If they are not in the same grid, interpolates them to dest grid

        Parameters

            radar_dest [radar object] the destination radar

            radar_orig [radar object] the radar object containing the original field

        Returns

            field_dest [dict] interpolated field and metadata

pyrad.io.**cosmo2radar_coord**(*radar*,   *cosmo_coord*,   *slice_xy=True*,   *slice_z=False*, *field_name=None*)
    Given the radar coordinates find the nearest COSMO model pixel

        Parameters

            radar [Radar] the radar object containing the information on the position of the radar gates

            cosmo_coord [dict] dictionary containing the COSMO coordinates

            slice_xy [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

> > > **slice_z** [boolean] if true the vertical plane of the COSMO field is cut to the dimensions of the radar field
> >
> > **field_name** [str] name of the field
>
> **Returns**
>
> > **cosmo_ind_field** [dict] dictionary containing a field of COSMO indices and metadata

pyrad.io.**cosmo2radar_data**(*radar, cosmo_coord, cosmo_data, time_index=0, slice_xy=True, slice_z=False, field_names=['temperature']*)
> get the COSMO value corresponding to each radar gate using nearest neighbour interpolation
>
> > **Parameters**
> >
> > > **radar** [Radar] the radar object containing the information on the position of the radar gates
> > >
> > > **cosmo_coord** [dict] dictionary containing the COSMO coordinates
> > >
> > > **cosmo_data** [dict] dictionary containing the COSMO data
> > >
> > > **time_index** [int] index of the forecasted data
> > >
> > > **slice_xy** [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field
> > >
> > > **slice_z** [boolean] if true the vertical plane of the COSMO field is cut to the dimensions of the radar field
> > >
> > > **field_names** [str] names of COSMO fields to convert (default temperature)
> >
> > **Returns**
> >
> > > **cosmo_fields** [list of dict] list of dictionary with the COSMO fields and metadata

pyrad.io.**find_hzt_file**(*voltime*, *cfg*, *ind_rad=0*)
> Search an ISO-0 degree file in HZT format
>
> > **Parameters**
> >
> > > **voltime** [datetime object] volume scan time
> > >
> > > **cfg** [dictionary of dictionaries] configuration info to figure out where the data is
> > >
> > > **ind_rad** [int] radar index
> >
> > **Returns**
> >
> > > **fname** [str] Name of HZT file if it exists. None otherwise

pyrad.io.**find_raw_cosmo_file**(*voltime*, *datatype*, *cfg*, *ind_rad=0*)
> Search a COSMO file in netcdf format
>
> > **Parameters**
> >
> > > **voltime** [datetime object] volume scan time
> > >
> > > **datatype** [str] type of COSMO data to look for
> > >
> > > **cfg** [dictionary of dictionaries] configuration info to figure out where the data is
> > >
> > > **ind_rad** [int] radar index
> >
> > **Returns**
> >
> > > **fname** [str] Name of COSMO file if it exists. None otherwise

pyrad.io.**generate_field_name_str**(*datatype*)
> Generates a field name in a nice to read format.

> **Parameters**
>
> > **datatype** [str] The data type
>
> **Returns**
>
> > **field_str** [str] The field name

pyrad.io.**get_cosmo_fields**(*cosmo_data, cosmo_ind, time_index=0, field_names=['temperature']*)

> Get the COSMO data corresponding to each radar gate using a precomputed look up table of the nearest neighbour
>
> **Parameters**
>
> > **cosmo_data** [dict] dictionary containing the COSMO data and metadata
> >
> > **cosmo_ind** [dict] dictionary containing a field of COSMO indices and metadata
> >
> > **time_index** [int] index of the forecasted data
> >
> > **field_names** [str] names of COSMO parameters (default temperature)
>
> **Returns**
>
> > **cosmo_fields** [list of dict] dictionary with the COSMO fields and metadata

pyrad.io.**get_data**(*voltime, datatypesdescr, cfg*)

> Reads pyrad input data.
>
> **Parameters**
>
> > **voltime** [datetime object] volume scan time
> >
> > **datatypesdescr** [list] list of radar field types to read. Format : [radarnr]:[datagroup]:[datatype],[dataset],[product] 'dataset' is only specified for data groups 'ODIM', 'CFRADIAL' and 'ODIMPYRAD'. 'product' is only specified for data groups 'CFRADIAL' and 'ODIMPYRAD' The data group specifies the type file from which data is extracted. It can be:
> >
> > > 'RAINBOW': Propietary Leonardo format 'COSMO': COSMO model data saved in Rainbow file format 'DEM': Visibility data saved in Rainbow file format
> > >
> > > **'RAD4ALP': METRANET format used for the operational MeteoSwiss**
> > > > data. To find out which datatype to use to match a particular METRANET field name check the function 'get_datatype_metranet' in pyrad/io/io_aux.py
> > >
> > > **'RAD4ALPCOSMO': COSMO model data saved in a binary file format.**
> > > > Used by operational MeteoSwiss radars
> > >
> > > **'RAD4ALPDEM': Visibility data saved in a binary format used by**
> > > > operational MeteoSwiss radars
> > >
> > > **'RAD4ALPHYDRO': Used to read the MeteoSwiss operational**
> > > > hydrometeor classification
> > >
> > > **'RAD4ALPDOPPLER': Used to read the MeteoSwiss operational**
> > > > dealiased Doppler velocity
> > >
> > > **'ODIM': Generic ODIM file format. For such types 'dataset'** specifies the directory and file name date convention. Example: ODIM:dBZ,D{%Y-%m-%d}-F{%Y%m%d%H%M%S}. To find out which datatype to use to match a particular ODIM field name check the function 'get_datatype_odim' in pyrad/io/io_aux.py
> > >
> > > 'MXPOL': MXPOL (EPFL) data written in a netcdf file

> > **'CFRADIAL': CFRadial format with the naming convention and** directory
> > structure in which Pyrad saves the data. For such datatypes 'dataset'
> > specifies the directory where the dataset is stored and 'product' spec-
> > ifies the directroy where the product is stored. Example: CFRA-
> > DIAL:dBZc,Att_ZPhi,SAVEVOL_dBZc
>
> > **'ODIMPYRAD': ODIM file format with the naming convention and**
> > directory structure in which Pyrad saves the data. For such datatypes
> > 'dataset' specifies the directory where the dataset is stored and 'prod-
> > uct' specifies the directroy where the product is stored. Example:
> > ODIMPYRAD:dBZc,Att_ZPhi,SAVEVOL_dBZc
>
> > 'RAINBOW', 'RAD4ALP', 'ODIM' and 'MXPOL' are primary data file sources and
> > they cannot be mixed for the same radar. It is also the case for their complementary data
> > files, i.e. 'COSMO' and 'RAD4ALPCOSMO', etc. 'CFRADIAL' and 'ODIMPYRAD'
> > are secondary data file sources and they can be combined with any other datagroup type.
> > For a list of accepted datatypes and how they map to the Py-ART name convention check
> > function 'get_field_name_pyart' in pyrad/io/io_aux.py
>
> > **cfg: dictionary of dictionaries** configuration info to figure out where the data is
>
> **Returns**
>
> > **radar** [Radar] radar object

pyrad.io.**get_dataset_fields**(*datasetdescr*)
>   splits the dataset type descriptor and provides each individual member
>
> **Parameters**
>
> > **datasetdescr** [str] dataset type. Format : [processing level]:[dataset type]
>
> **Returns**
>
> > **proclevel** [str] dataset processing level
>
> > **dataset** [str] dataset type, i.e. dBZ, ZDR, ISO0, . . .

pyrad.io.**get_datatype_fields**(*datadescriptor*)
>   splits the data type descriptor and provides each individual member
>
> **Parameters**
>
> > **datadescriptor** [str] radar field type. Format : [radar file type]:[datatype]
>
> **Returns**
>
> > **radarnr** [str] radar number, i.e. RADAR1, RADAR2, . . .
>
> > **datagroup** [str] data type group, i.e. RAINBOW, RAD4ALP, ODIM, CFRADIAL, COSMO,
> > MXPOL . . .
>
> > **datatype** [str] data type, i.e. dBZ, ZDR, ISO0, . . .
>
> > **dataset** [str] dataset type (for saved data only)
>
> > **product** [str] product type (for saved data only)

pyrad.io.**get_datetime**(*fname*, *datadescriptor*)
>   Given a data descriptor gets date and time from file name
>
> **Parameters**
>
> > **fname** [str] file name
>
> > **datadescriptor** [str] radar field type. Format : [radar file type]:[datatype]

Returns

> **fdatetime** [datetime object] date and time in file name

pyrad.io.**get_field_unit**(*datatype*)

> Return unit of datatype.

> **Parameters**

> > **datatype** [str] The data type

> **Returns**

> > **unit** [str] The unit

pyrad.io.**get_fieldname_cosmo**(*field_name*)

> maps the Py-ART field name into the corresponding COSMO variable name

> **Parameters**

> > **field_name** [str] Py-ART field name

> **Returns**

> > **cosmo_name** [str] Py-ART variable name

pyrad.io.**get_fieldname_pyart**(*datatype*)

> maps the config file radar data type name into the corresponding rainbow Py-ART field name

> **Parameters**

> > **datatype** [str] config file radar data type name

> **Returns**

> > **field_name** [str] Py-ART field name

pyrad.io.**get_file_list**(*datadescriptor*, *starttime*, *endtime*, *cfg*, *scan=None*)

> gets the list of files with a time period

> **Parameters**

> > **datadescriptor** [str] radar field type. Format : [radar file type]:[datatype]

> > **starttime** [datetime object] start of time period

> > **endtime** [datetime object] end of time period

> > **cfg: dictionary of dictionaries** configuration info to figure out where the data is

> > **scan** [str] scan name

> **Returns**

> > **filelist** [list of strings] list of files within the time period

pyrad.io.**get_iso0_field**(*hzt_data*, *hzt_ind*, *z_radar*, *field_name='height_over_iso0'*)

> Get the height over iso0 data corresponding to each radar gate using a precomputed look up table of the nearest neighbour

> **Parameters**

> > **hzt_data** [dict] dictionary containing the HZT data and metadata

> > **hzt_ind** [dict] dictionary containing a field of HZT indices and metadata

> > **z_radar** [ndarray] gates altitude [m MSL]

> > **field_name** [str] names of HZT parameters (default height_over_iso0)

>> **Returns**

>>> **iso0_field** [list of dict] dictionary with the height over iso0 field and metadata

pyrad.io.**get_new_rainbow_file_name**(*master_fname*, *master_datadescriptor*, *datatype*)
>> get the rainbow file name containing datatype from a master file name and data type

>> **Parameters**

>>> **master_fname** [str] the master file name

>>> **master_datadescriptor** [str] the master data type descriptor

>>> **datatype** [str] the data type of the new file name to be created

>> **Returns**

>>> **new_fname** [str] the new file name

pyrad.io.**get_save_dir**(*basepath*, *procname*, *dsname*, *prdname*, *timeinfo=None*, *timeformat='%Y-%m-%d'*, *create_dir=True*)
>> obtains the path to a product directory and eventually creates it

>> **Parameters**

>>> **basepath** [str] product base path

>>> **procname** [str] name of processing space

>>> **dsname** [str] data set name

>>> **prdname** [str] product name

>>> **timeinfo** [datetime] time info to generate the date directory. If None there is no time format in the path

>>> **timeformat** [str] Optional. The time format.

>>> **create_dir** [boolean] If True creates the directory

>> **Returns**

>>> **savedir** [str] path to product

pyrad.io.**get_sensor_data**(*date*, *datatype*, *cfg*)
>> Gets data from a point measurement sensor (rain gauge or disdrometer)

>> **Parameters**

>>> **date** [datetime object] measurement date

>>> **datatype** [str] name of the data type to read

>>> **cfg** [dictionary] dictionary containing sensor information

>> **Returns**

>>> **sensordate , sensorvalue, label, period** [tuple] date, value, type of sensor and measurement period

pyrad.io.**get_trtfile_list**(*datapath*, *starttime*, *endtime*)
>> gets the list of TRT files with a time period

>> **Parameters**

>>> **datapath** [str] directory where to look for data

>>> **starttime** [datetime object] start of time period

>>> **endtime** [datetime object] end of time period

Returns

>   **filelist** [list of strings] list of files within the time period

pyrad.io.**hzt2radar_coord**(*radar*, *hzt_coord*, *slice_xy=True*, *field_name=None*)
>   Given the radar coordinates find the nearest HZT pixel

>   **Parameters**

>>   **radar** [Radar] the radar object containing the information on the position of the radar gates

>>   **hzt_coord** [dict] dictionary containing the HZT coordinates

>>   **slice_xy** [boolean] if true the horizontal plane of the HZT field is cut to the dimensions of the radar field

>>   **field_name** [str] name of the field

>   **Returns**

>>   **hzt_ind_field** [dict] dictionary containing a field of HZT indices and metadata

pyrad.io.**hzt2radar_data**(*radar*, *hzt_coord*, *hzt_data*, *slice_xy=True*, *field_name='height_over_iso0'*)
>   get the HZT value corresponding to each radar gate using nearest neighbour interpolation

>   **Parameters**

>>   **radar** [Radar] the radar object containing the information on the position of the radar gates

>>   **hzt_coord** [dict] dictionary containing the HZT coordinates

>>   **hzt_data** [dict] dictionary containing the HZT data

>>   **slice_xy** [boolean] if true the horizontal plane of the COSMO field is cut to the dimensions of the radar field

>>   **field_name** [str] name of HZT fields to convert (default height_over_iso0)

>   **Returns**

>>   **hzt_fields** [list of dict] list of dictionary with the HZT fields and metadata

pyrad.io.**interpol_field**(*radar_dest*, *radar_orig*, *field_name*, *fill_value=None*, *ang_tol=0.5*)
>   interpolates field field_name contained in radar_orig to the grid in radar_dest

>   **Parameters**

>>   **radar_dest** [radar object] the destination radar

>>   **radar_orig** [radar object] the radar object containing the original field

>>   **field_name: str** name of the field to interpolate

>>   **fill_value: float** The fill value

>>   **ang_tol** [float] angle tolerance to determine whether the radar origin sweep is the radar destination sweep

>   **Returns**

>>   **field_dest** [dict] interpolated field and metadata

pyrad.io.**make_filename**(*prdtype*, *dstype*, *dsname*, *ext_list*, *prdcfginfo=None*, *timeinfo=None*, *timeformat='%Y%m%d%H%M%S'*, *runinfo=None*)
>   creates a product file name

>   **Parameters**

> > > **timeinfo** [datetime] time info to generate the date directory
> > >
> > > **prdtype** [str] product type, i.e. 'ppi', etc.
> > >
> > > **dstype** [str] data set type, i.e. 'raw', etc.
> > >
> > > **dsname** [str] data set name
> > >
> > > **ext_list** [list of str] file name extensions, i.e. 'png'
> > >
> > > **prdcfginfo** [str] Optional. string to add product configuration information, i.e. 'el0.4'
> > >
> > > **timeformat** [str] Optional. The time format
> > >
> > > **runinfo** [str] Optional. Additional information about the test (e.g. 'RUN01', 'TS011')
> >
> > **Returns**
> >
> > > **fname_list** [list of str] list of file names (as many as extensions)

pyrad.io.**map_Doppler**(*Doppler_data_bin*, *Nyquist_vel*)

> maps the binary METRANET Doppler data to actual Doppler velocity
>
> > **Parameters**
> >
> > > **Doppler_data_bin** [numpy array] The binary METRANET data
> >
> > **Returns**
> >
> > > **Doppler_data** [numpy array] The Doppler veloctiy in [m/s]

pyrad.io.**map_hydro**(*hydro_data_op*)

> maps the operational hydrometeor classification identifiers to the ones used by Py-ART
>
> > **Parameters**
> >
> > > **hydro_data_op** [numpy array] The operational hydrometeor classification data
> >
> > **Returns**
> >
> > > **hydro_data_py** [numpy array] The pyart hydrometeor classification data

pyrad.io.**read_antenna_pattern**(*fname*, *linear=False*, *twoway=False*)

> Read antenna pattern from file
>
> > **Parameters**
> >
> > > **fname** [str] path of the antenna pattern file
> > >
> > > **linear** [boolean] if true the antenna pattern is given in linear units
> > >
> > > **twoway** [boolean] if true the attenuation is two-way
> >
> > **Returns**
> >
> > > **pattern** [dict] dictionary with the fields angle and attenuation

pyrad.io.**read_colocated_data**(*fname*)

> Reads a csv files containing colocated data
>
> > **Parameters**
> >
> > > **fname** [str] path of time series file
> >
> > **Returns**
> >
> > > **rad1_time, rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,**
> > >
> > > **rad1_val, rad2_time, rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_azi,**

---

rad2_rng, rad2_val [tupple] A tupple with the data read. None otherwise

pyrad.io.**read_colocated_gates**(*fname*)

Reads a csv files containing the position of colocated gates

> **Parameters**
>
> > **fname** [str] path of time series file
>
> **Returns**
>
> > **rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,**
> >
> > **rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_azi, rad2_rng** [tupple] A tupple with the data read. None otherwise

pyrad.io.**read_config**(*fname*, *cfg=None*)

Read a pyrad config file.

> **Parameters**
>
> > **fname** [str] Name of the configuration file to read.
> >
> > **cfg** [dict of dicts, optional] dictionary of dictionaries containing configuration parameters where the new parameters will be placed
>
> **Returns**
>
> > **cfg** [dict of dicts] dictionary of dictionaries containing the configuration parameters

pyrad.io.**read_cosmo_coord**(*fname*, *zmin=None*)

Reads COSMO coordinates from a netcdf file

> **Parameters**
>
> > **fname** [str] name of the file to read
>
> **Returns**
>
> > **cosmo_coord** [dictionary] dictionary with the data and metadata

pyrad.io.**read_cosmo_data**(*fname, field_names=['temperature'], celsius=True*)

Reads COSMO data from a netcdf file

> **Parameters**
>
> > **fname** [str] name of the file to read
> >
> > **field_names** [str] name of the variable to read
> >
> > **celsius** [Boolean] if True and variable temperature converts data from Kelvin to Centigrade
>
> **Returns**
>
> > **cosmo_data** [dictionary] dictionary with the data and metadata

pyrad.io.**read_disdro_scattering**(*fname*)

Reads scattering parameters computed from disdrometer data contained in a text file

> **Parameters**
>
> > **fname** [str] path of time series file
>
> **Returns**
>
> > **date, preciptype, lwc, rr, zh, zv, zdr, ldr, ah, av, adiff, kdp, deltaco,**
> >
> > **rhohv** [tupple] The read values

pyrad.io.**read_excess_gates**(*fname*)

Reads a csv files containing the position of gates exceeding a given percentile of frequency of occurrence

> **Parameters**
>
>> **fname** [str] path of time series file
>
> **Returns**
>
>> **rad1_ray_ind, rad1_rng_ind, rad1_ele, rad1_azi, rad1_rng,**
>>
>> **rad2_ray_ind, rad2_rng_ind, rad2_ele, rad2_azi, rad2_rng** [tuple] A tupple with the
>>> data read. None otherwise

pyrad.io.**read_histogram**(*fname*)

Reads a histogram contained in a csv file

> **Parameters**
>
>> **fname** [str] path of time series file
>
> **Returns**
>
>> **hist , bin_edges** [tupple] The read data. None otherwise

pyrad.io.**read_histogram_ts**(*fname_list*, *datatype*, *t_res=300.0*)

Reads a colection of histogram data file and creates a time series

> **Parameters**
>
>> **fname_list** [str] list of files to read
>>
>> **datatype** [str] The data type (dBZ, ZDR, etc.)
>>
>> **t_res** [float] time resolution [s]. If None the time resolution is taken as the median
>
> **Returns**
>
>> **tbin_edges, bin_edges, data_ma, datetime_arr[0]** [tuple] The read data. None otherwise

pyrad.io.**read_hzt_data**(*fname*, *chy0=255.0*, *chx0=-160.0*)

Reads iso-0 degree data from an HZT file

> **Parameters**
>
>> **fname** [str] name of the file to read
>>
>> **chy0, chx0: south west point of grid in Swiss coordinates [km]**
>
> **Returns**
>
>> **hzt_data** [dictionary] dictionary with the data and metadata

pyrad.io.**read_intercomp_scores_ts**(*fname*, *sort_by_date=False*)

Reads a radar intercomparison scores csv file

> **Parameters**
>
>> **fname** [str] path of time series file
>>
>> **sort_by_date** [bool] if True, the read data is sorted by date prior to exit
>
> **Returns**
>
>> **date_vec, np_vec, meanbias_vec, medianbias_vec, quant25bias_vec,**
>>
>> **quant75bias_vec, modebias_vec, corr_vec, slope_vec, intercep_vec,**
>>
>> **intercep_slope1_vec** [tuple] The read data. None otherwise

pyrad.io.**read_last_state**(*fname*)

    Reads a file containing the date of acquisition of the last volume processed

        Parameters

            fname [str] name of the file to read

        Returns

            last_state [datetime object] the date

pyrad.io.**read_lightning**(*fname*, *filter_data=True*)

    Reads lightning data contained in a text file. The file has the following fields:

        flashnr: (0 is for noise) UTC seconds of the day Time within flash (in seconds) Latitude (decimal degrees) Longitude (decimal degrees) Altitude (m MSL) Power (dBm)

        Parameters

            fname [str] path of time series file

            filter_data [Boolean] if True filter noise (flashnr = 0)

        Returns

            flashnr, time_data, time_in_flash, lat, lon, alt, dBm [tupple] A tupple containing the read values. None otherwise

pyrad.io.**read_lightning_all**(*fname, labels=['hydro [-]', 'KDPc [deg/Km]', 'dBZc [dBZ]', 'Rho-HVc [-]', 'TEMP [deg C]', 'ZDRc [dB]']*)

    Reads a file containing lightning data and co-located polarimetric data. fields:

        flashnr time data Time within flash (in seconds) Latitude (decimal degrees) Longitude (decimal degrees) Altitude (m MSL) Power (dBm) Polarimetric values at flash position

        Parameters

            fname [str] path of time series file

            labels [list of str] The polarimetric variables labels

        Returns

            flashnr, time_data, time_in_flash, lat, lon, alt, dBm,

            pol_vals_dict [tupple] A tupple containing the read values. None otherwise

pyrad.io.**read_lightning_traj**(*fname*)

    Reads lightning trajectory data contained in a csv file. The file has the following fields:

        Date UTC [seconds since midnight] # Flash Flash Power (dBm) Value at flash Mean value in a 3x3x3 polar box Min value in a 3x3x3 polar box Max value in a 3x3x3 polar box # valid values in the polar box

        Parameters

            fname [str] path of time series file

        Returns

            time_flash, flashnr, dBm, val_at_flash, val_mean, val_min, val_max,

            nval [tupple] A tupple containing the read values. None otherwise

pyrad.io.**read_meteorage**(*fname*)

> Reads METEORAGE lightning data contained in a text file. The file has the following fields:

> > date: date + time + time zone lon: longitude [degree] lat: latitude [degree] intens: amplitude [kilo amperes] ns: number of strokes of the flash mode: kind of localization [0,15] intra: 1 = intra-cloud , 0 = cloud-to-ground ax: length of the semi-major axis of the ellipse [km] ki2: standard deviation on the localization computation (Ki^2) ecc: eccentricity (major-axis / minor-axis) incl: ellipse inclination (angle with respect to the North, +90° is

> > > East) [degrees]

> > sind: stroke index within the flash

> > **Parameters**

> > > **fname** [str] path of time series file

> > **Returns**

> > > **stroke_time, lon, lat, intens, ns, mode, intra, ax, ki2, ecc, incl,**

> > > **sind** [tupple] A tupple containing the read values. None otherwise

pyrad.io.**read_ml_ts**(*fname*)

> Reads a melting layer time series contained in a csv file

> > **Parameters**

> > > **fname** [str] path of time series file

> > **Returns**

> > > **dt_ml, ml_top_avg, ml_top_std, thick_avg, thick_std, nrays_valid,**

> > > **nrays_total** [tupple] The read data. None otherwise

pyrad.io.**read_monitoring_ts**(*fname*, *sort_by_date=False*)

> Reads a monitoring time series contained in a csv file

> > **Parameters**

> > > **fname** [str] path of time series file

> > > **sort_by_date** [bool] if True, the read data is sorted by date prior to exit

> > **Returns**

> > > **date , np_t, central_quantile, low_quantile, high_quantile** [tupple] The read data. None otherwise

pyrad.io.**read_profile_ts**(*fname_list*, *labels*, *hres=None*, *label_nr=0*, *t_res=300.0*)

> Reads a colection of profile data file and creates a time series

> > **Parameters**

> > > **fname_list** [str] list of files to read

> > > **labels** [list of str] The data labels

> > > **hres** [float] Height resolution

> > > **label_nr** [int] the label nr of the data that will be used in the time series

> > > **t_res** [float] time resolution [s]. If None the time resolution is taken as the median

> > **Returns**

> > **tbin_edges, hbin_edges, np_ma, data_ma, datetime_arr[0]** [tupple] The read data. None
> > otherwise

pyrad.io.**read_quantiles**(*fname*)

> Reads quantiles contained in a csv file

> > **Parameters**

> > > **fname** [str] path of time series file

> > **Returns**

> > > **quantiles, values** [tupple] The read data. None otherwise

pyrad.io.**read_quantiles_ts**(*fname_list*, *step=5.0*, *qmin=0.0*, *qmax=100.0*, *t_res=300.0*)

> Reads a colection of quantiles data file and creates a time series

> > **Parameters**

> > > **fname_list** [str] list of files to read

> > > **step, qmin, qmax** [float] The minimum, maximum and step quantiles

> > > **t_res** [float] time resolution [s]. If None the time resolution is taken as the median

> > **Returns**

> > > **tbin_edges, qbin_edges, data_ma, datetime_arr[0]** [tupple] The read data. None other-
> > > wise

pyrad.io.**read_rad4alp_cosmo**(*fname*, *datatype*, *ngates=0*)

> Reads rad4alp COSMO data binary file.

> > **Parameters**

> > > **fname** [str] name of the file to read

> > > **datatype** [str] name of the data type

> > > **ngates** [int] maximum number of range gates per ray. If larger than 0 the radar field will be
> > > cut accordingly.

> > **Returns**

> > > **field** [dictionary] The data field

pyrad.io.**read_rad4alp_vis**(*fname*, *datatype*)

> Reads rad4alp visibility data binary file.

> > **Parameters**

> > > **fname** [str] name of the file to read

> > > **datatype** [str] name of the data type

> > **Returns**

> > > **field_list** [list of dictionaries] A data field. Each element of the list corresponds to one eleva-
> > > tion

pyrad.io.**read_rhi_profile**(*fname*, *labels=['50.0-percentile', '25.0-percentile', '75.0-percentile']*)

> Reads a monitoring time series contained in a csv file

> > **Parameters**

> > > **fname** [str] path of time series file

> > > **labels** [list of str] The data labels

4.8. TimeSeries 83

Returns

> **height, np_t, vals** [tuple] The read data. None otherwise

pyrad.io.**read_selfconsistency**(*fname*)

> Reads a self-consistency table with Zdr, Kdp/Zh columns

Parameters

> **fname** [str] path of time series file

Returns

> **zdr, kdpzh** [arrays] The read values

pyrad.io.**read_smn**(*fname*)

> Reads SwissMetNet data contained in a csv file

Parameters

> **fname** [str] path of time series file

Returns

> **smn_id, date , pressure, temp, rh, precip, wspeed, wdir** [tupple] The read values

pyrad.io.**read_smn2**(*fname*)

> Reads SwissMetNet data contained in a csv file with format station,time,value

Parameters

> **fname** [str] path of time series file

Returns

> **smn_id, date , value** [tupple] The read values

pyrad.io.**read_solar_flux**(*fname*)

> Reads solar flux data from the DRAO observatory in Canada

Parameters

> **fname** [str] path of time series file

Returns

> **flux_datetime** [datetime array] the date and time of the solar flux retrievals
>
> **flux_value** [array] the observed solar flux

pyrad.io.**read_status**(*voltime*, *cfg*, *ind_rad=0*)

> Reads rad4alp xml status file.

Parameters

> **voltime** [datetime object] volume scan time
>
> **cfg: dictionary of dictionaries** configuration info to figure out where the data is
>
> **ind_rad: int** radar index

Returns

> **root** [root element object] The information contained in the status file

pyrad.io.**read_sun_hits**(*fname*)

> Reads sun hits data contained in a csv file

Parameters

> **fname** [str] path of time series file

> **Returns**

>> **date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,**

>> **pv, pv_std, npv, nvalv, zdr, zdr_std, nzdr, nvalzdr** [tupple] Each parameter is an array containing a time series of information on a variable

pyrad.io.**read_sun_hits_multiple_days**(*cfg*, *time_ref*, *nfiles=1*)

> Reads sun hits data from multiple file sources

>> **Parameters**

>>> **cfg** [dict] dictionary with configuration data to find out the right file

>>> **time_ref** [datetime object] reference time

>>> **nfiles** [int] number of files to read

>> **Returns**

>>> **date, ray, nrng, rad_el, rad_az, sun_el, sun_az, ph, ph_std, nph, nvalh,**

>>> **pv, pv_std, npv, nvalv, zdr, zdr_std, nzdr, nvalzdr** [tupple] Each parameter is an array containing a time series of information on a variable

pyrad.io.**read_sun_retrieval**(*fname*)

> Reads sun retrieval data contained in a csv file

>> **Parameters**

>>> **fname** [str] path of time series file

>> **Returns**

>>> **first_hit_time, last_hit_time, nhits_h, el_width_h, az_width_h, el_bias_h,**

>>> **az_bias_h, dBm_sun_est, std_dBm_sun_est, sf_h,**

>>> **nhits_v, el_width_v, az_width_v, el_bias_v, az_bias_v, dBmv_sun_est,**

>>> **std_dBmv_sun_est, sf_v,**

>>> **nhits_zdr, zdr_sun_est, std_zdr_sun_est,**

>>> **sf_ref, ref_time** [tupple] Each parameter is an array containing a time series of information on a variable

pyrad.io.**read_timeseries**(*fname*)

> Reads a time series contained in a csv file

>> **Parameters**

>>> **fname** [str] path of time series file

>> **Returns**

>>> **date , value** [tupple] A datetime object array containing the time and a numpy masked array containing the value. None otherwise

pyrad.io.**read_trt_cell_lightning**(*fname*)

> Reads the lightning data of a TRT cell. The file has the following fields:

> traj_ID yyyymmddHHMM lon lat area RANKr nflashes flash_dens

>> **Parameters**

> **fname** [str] path of the TRT data file

> **Returns**

> > **A tupple containing the read values. None otherwise**

pyrad.io.**read_trt_data**(*fname*)

> Reads the TRT data contained in a text file. The file has the following fields:

> > traj_ID yyyymmddHHMM

> > Description of ellipsis: lon [deg] lat [deg] ell_L [km] long ell_S [km] short ell_or [deg] orientation area [km2]

> > Cell speed: vel_x [km/h] vel_y [km/h] det [dBZ]: detection threshold RANKr from 0 to 40 (int)

> > Lightning information: CG- number (int) CG+ number (int) CG number (int) %CG+ [%]

> > Echo top information: ET45 [km] echotop 45 max ET45m [km] echotop 45 median ET15 [km] echotop 15 max ET15m [km] echotop 15 median

> > VIL and max echo: VIL [kg/m2] vertical integrated liquid content maxH [km] height of maximum reflectivity (maximum on the cell) maxHm [km] height of maximum reflectivity (median per cell)

> > POH [%] RANK (deprecated)

> > standard deviation of the current time step cell velocity respect to the previous time: Dvel_x [km/h] Dvel_y [km/h]

> > cell_contour_lon-lat

> > **Parameters**

> > > **fname** [str] path of the TRT data file

> > **Returns**

> > > **A tupple containing the read values. None otherwise**

pyrad.io.**read_trt_scores**(*fname*)

> Reads the TRT scores contained in a text file. The file has the following fields:

> > traj ID max flash density time max flash density rank max flash density max rank time max rank

> > **Parameters**

> > > **fname** [str] path of the TRT data file

> > **Returns**

> > > **A tupple containing the read values. None otherwise**

pyrad.io.**read_trt_traj_data**(*fname*)

> Reads the TRT cell data contained in a text file. The file has the following fields:

> > traj_ID yyyymmddHHMM

> > lon [deg] lat [deg] ell_L [km] long ell_S [km] short ell_or [deg] orientation area [km2]

> > vel_x [km/h] cell speed vel_y [km/h] det [dBZ] detection threshold RANKr from 0 to 40 (int)

> > CG- number (int) CG+ number (int) CG number (int) %CG+ [%]

ET45 [km] echotop 45 max ET45m [km] echotop 45 median ET15 [km] echotop 15 max ET15m [km] echotop 15 median VIL [kg/m2] vertical integrated liquid content maxH [km] height of maximum reflectivity (maximum on the cell) maxHm [km] height of maximum reflectivity (median per cell) POH [%] RANK (deprecated)

Standard deviation of the current time step cell velocity respect to the previous time: Dvel_x [km/h] Dvel_y [km/h]

cell_contour_lon-lat

> **Parameters**
>
> > **fname** [str] path of the TRT data file
>
> **Returns**
>
> > **A tupple containing the read values. None otherwise**

pyrad.io.**read_ts_cum**(*fname*)

> Reads a time series of precipitation accumulation contained in a csv file
>
> **Parameters**
>
> > **fname** [str] path of time series file
>
> **Returns**
>
> > **date, np_radar, radar_value, np_sensor, sensor_value** [tupple] The data read

pyrad.io.**send_msg**(*sender*, *receiver_list*, *subject*, *fname*)

> sends the content of a text file by email
>
> **Parameters**
>
> > **sender** [str] the email address of the sender
> >
> > **receiver_list** [list of string] list with the email addresses of the receiver
> >
> > **subject** [str] the subject of the email
> >
> > **fname** [str] name of the file containing the content of the email message
>
> **Returns**
>
> > **fname** [str] the name of the file containing the content

pyrad.io.**write_alarm_msg**(*radar_name*, *param_name_unit*, *date_last*, *target*, *tol_abs*, *np_trend*, *value_trend*, *tol_trend*, *nevents*, *np_last*, *value_last*, *fname*)

> writes an alarm file
>
> **Parameters**
>
> > **radar_name** [str] Name of the radar being controlled
> >
> > **param_name_unit** [str] Parameter and units
> >
> > **date_last** [datetime object] date of the current event
> >
> > **target, tol_abs** [float] Target value and tolerance
> >
> > **np_trend** [int] Total number of points in trend
> >
> > **value_trend, tol_trend** [float] Trend value and tolerance
> >
> > **nevents: int** Number of events in trend
> >
> > **np_last** [int] Number of points in the current event

> **value_last** [float] Value of the current event
>
> **fname** [str] Name of file where to store the alarm information

> **Returns**

> **fname** [str] the name of the file where data has written

pyrad.io.**write_cdf**(*quantiles*, *values*, *ntot*, *nnan*, *nclut*, *nblocked*, *nprec_filter*, *noutliers*, *ncdf*, *fname*, *use_nans=False*, *nan_value=0.0*, *filterprec=[]*, *vismin=None*, *sector=None*, *datatype=None*, *timeinfo=None*)

writes a cumulative distribution function

> **Parameters**

> **quantiles** [datetime array] array containing the measurement time

> **values** [float array] array containing the average value

> **fname** [float array] array containing the standard deviation

> **sector** [str] file name where to store the data

> **Returns**

> **fname** [str] the name of the file where data has written

pyrad.io.**write_colocated_data**(*coloc_data*, *fname*)

Writes the data of gates colocated with two radars

> **Parameters**

> **coloc_data** [dict] dictionary containing the colocated data parameters

> **fname** [str] file name where to store the data

> **Returns**

> **fname** [str] the name of the file where data has written

pyrad.io.**write_colocated_data_time_avg**(*coloc_data*, *fname*)

Writes the time averaged data of gates colocated with two radars

> **Parameters**

> **coloc_data** [dict] dictionary containing the colocated data parameters

> **fname** [str] file name where to store the data

> **Returns**

> **fname** [str] the name of the file where data has written

pyrad.io.**write_colocated_gates**(*coloc_gates*, *fname*)

Writes the position of gates colocated with two radars

> **Parameters**

> **coloc_gates** [dict] dictionary containing the colocated gates parameters

> **fname** [str] file name where to store the data

> **Returns**

> **fname** [str] the name of the file where data has written

pyrad.io.**write_excess_gates**(*excess_dict*, *fname*)

Writes the position and values of gates that have a frequency of occurrence higher than a particular threshold

> **Parameters**

> > **excess_dict** [dict] dictionary containing the gates parameters
>
> > **fname** [str] file name where to store the data
>
> **Returns**
>
> > **fname** [str] the name of the file where data has written

pyrad.io.**write_field_coverage**(*quantiles*, *values*, *ele_start*, *ele_stop*, *azi_start*, *azi_stop*, *threshold*, *nvalid_min*, *datatype*, *timeinfo*, *fname*)
> writes the quantiles of the coverage on a particular sector
>
> **Parameters**
>
> > **quantiles** [datetime array] array containing the quantiles computed
> >
> > **values** [float array] quantile value
> >
> > **ele_start, ele_stop, azi_start, azi_stop** [float] The limits of the sector
> >
> > **threshold** [float] The minimum value to consider the data valid
> >
> > **nvalid_min** [int] the minimum number of points to consider that there are values in a ray
> >
> > **datatype** [str] data type and units
> >
> > **timeinfo** [datetime object] the time stamp of the data
> >
> > **fname** [str] name of the file where to write the data
>
> **Returns**
>
> > **fname** [str] the name of the file where data has written

pyrad.io.**write_histogram**(*bin_edges*, *values*, *fname*, *datatype='undefined'*, *step=0*)
> writes a histogram
>
> **Parameters**
>
> > **bin_edges** [float array] array containing the histogram bin edges
> >
> > **values** [int array] array containing the number of points in each bin
> >
> > **fname** [str] file name
> >
> > **datatype :str** The data type
> >
> > **step** [str] The bin step
>
> **Returns**
>
> > **fname** [str] the name of the file where data has written

pyrad.io.**write_intercomp_scores_ts**(*start_time*, *stats*, *field_name*, *fname*, *rad1_name='RADAR001'*, *rad2_name='RADAR002'*, *rewrite=False*)
> writes time series of radar intercomparison scores
>
> **Parameters**
>
> > **start_time** [datetime object or array of date time objects] the time of the intercomparison
> >
> > **stats** [dict] dictionary containing the statistics
> >
> > **field_name** [str] The name of the field
> >
> > **fname** [str] file name where to store the data
> >
> > **rad1_name, rad2_name** [str] Name of the radars intercompared

---

> **rewrite** [bool] if True a new file is created

> **Returns**

>> **fname** [str] the name of the file where data has written

pyrad.io.**write_last_state**(*datetime_last*, *fname*)
   writes SwissMetNet data in format datetime,avg_value, std_value

> **Parameters**

>> **datetime_last** [datetime object] date and time of the last state

>> **fname** [str] file name where to store the data

> **Returns**

>> **fname** [str] the name of the file where data has written

pyrad.io.**write_monitoring_ts**(*start_time*, *np_t*, *values*, *quantiles*, *datatype*, *fname*, *rewrite=False*)
   writes time series of data

> **Parameters**

>> **start_time** [datetime object or array of date time objects] the time of the monitoring

>> **np_t** [int or array of ints] the total number of points

>> **values: float array with 3 elements of array of arrays** the values at certain quantiles

>> **quantiles: float array with 3 elements** the quantiles computed

>> **datatype** [str] The data type

>> **fname** [str] file name where to store the data

>> **rewrite** [bool] if True a new file is created

> **Returns**

>> **fname** [str] the name of the file where data has written

pyrad.io.**write_quantiles**(*quantiles*, *values*, *fname*, *datatype='undefined'*)
   writes quantiles

> **Parameters**

>> **quantiles** [float array] array containing the quantiles to write

>> **values** [float array] array containing the value of each quantile

>> **fname** [str] file name

>> **datatype :str** The data type

> **Returns**

>> **fname** [str] the name of the file where data has written

pyrad.io.**write_rhi_profile**(*hvec*, *data*, *nvalid_vec*, *labels*, *fname*, *datatype=None*, *timeinfo=None*,
                               sector=None)
   writes the values of an RHI profile in a text file

> **Parameters**

>> **hvec** [float array] array containing the alitude in m MSL

>> **data** [list of float array] the quantities at each altitude

>> **nvalid_vec** [int array] number of valid data points used to compute the quantiles

---

>>>>**labels** [list of strings] label specifying the quantitites in data

>>>>**fname** [str] file name where to store the data

>>>>**datatype** [str] the data type

>>>>**timeinfo** [datetime object] time of the rhi profile

>>>>**sector** [dict] dictionary specying the sector limits

>>>**Returns**

>>>>**fname** [str] the name of the file where data has been written

pyrad.io.**write_smn**(*datetime_vec*, *value_avg_vec*, *value_std_vec*, *fname*)
>>writes SwissMetNet data in format datetime,avg_value, std_value

>>>**Parameters**

>>>>**datetime_vec** [datetime array] array containing the measurement time

>>>>**value_avg_vec** [float array] array containing the average value

>>>>**value_std_vec** [float array] array containing the standard deviation

>>>>**fname** [str] file name where to store the data

>>>**Returns**

>>>>**fname** [str] the name of the file where data has written

pyrad.io.**write_sun_hits**(*sun_hits*, *fname*)
>>Writes sun hits data.

>>>**Parameters**

>>>>**sun_hits** [dict] dictionary containing the sun hits parameters

>>>>**fname** [str] file name where to store the data

>>>**Returns**

>>>>**fname** [str] the name of the file where data has written

pyrad.io.**write_sun_retrieval**(*sun_retrieval*, *fname*)
>>Writes sun retrieval data.

>>>**Parameters**

>>>>**sun_retrieval** [dict] dictionary containing the sun retrieval parameters

>>>>**fname** [str] file name where to store the data

>>>**Returns**

>>>>**fname** [str] the name of the file where data has written

pyrad.io.**write_trt_cell_data**(*traj_ID*, *yyyymmddHHMM*, *lon*, *lat*, *ell_L*, *ell_S*, *ell_or*, *area*, *vel_x*, *vel_y*, *det*, *RANKr*, *CG_n*, *CG_p*, *CG*, *CG_percent_p*, *ET45*, *ET45m*, *ET15*, *ET15m*, *VIL*, *maxH*, *maxHm*, *POH*, *RANK*, *Dvel_x*, *Dvel_y*, *cell_contour*, *fname*)
>>writes TRT cell data

>>>**Parameters**

CHAPTER

FIVE

PLOTTING (`PYRAD.GRAPH`)

Functions to plot graphics.

5.1 Plots

plot_surface(grid, field_name, level, …)	plots a surface from gridded data
plot_latitude_slice(grid, field_name, lon, …)	plots a latitude slice from gridded data
plot_longitude_slice(grid, field_name, lon, …)	plots a longitude slice from gridded data
plot_latlon_slice(grid, field_name, coord1, …)	plots a croos section crossing two points in the grid
plot_ppi(radar, field_name, ind_el, prdcfg, …)	plots a PPI
plot_ppi_contour(radar, field_name, ind_el, …)	plots contour data on a PPI
plot_ppi_map(radar, field_name, ind_el, …)	plots a PPI on a geographic map
plot_rhi(radar, field_name, ind_az, prdcfg, …)	plots an RHI
plot_rhi_contour(radar, field_name, ind_az, …)	plots contour data on an RHI
plot_bscope(radar, field_name, ind_sweep, …)	plots a B-Scope (angle-range representation)
plot_fixed_rng(radar, field_name, prdcfg, …)	plots a fixed range plot
plot_time_range(radar, field_name, …)	plots a time-range plot
plot_rhi_profile(data_list, hvec, fname_list)	plots an RHI profile
plot_along_coord(xval_list, yval_list, …)	plots data along a certain radar coordinate
plot_field_coverage(xval_list, yval_list, …)	plots a time series
plot_density(hist_obj, hist_type, … [, …])	density plot (angle-values representation)
plot_cappi(radar, field_name, altitude, …)	plots a Constant Altitude Plan Position Indicator CAPPI
plot_traj(rng_traj, azi_traj, ele_traj, …)	plots a trajectory on a Cartesian surface
plot_pos(lat, lon, alt, fname_list[, ax, …])	plots a trajectory on a Cartesian surface
plot_quantiles(quant, value, fname_list[, …])	plots quantiles
plot_histogram(bin_edges, values, fname_list)	computes and plots histogram
plot_histogram2(bin_centers, hist, fname_list)	plots histogram
plot_antenna_pattern(antpattern, fname_list)	plots an antenna pattern
plot_timeseries(tvec, data_list, fname_list)	plots a time series
plot_timeseries_comp(date1, value1, date2, …)	plots 2 time series in the same graph
plot_monitoring_ts(date, np_t, cquant, …)	plots a time series of monitoring data
plot_scatter_comp(value1, value2, fname_list)	plots the scatter between two time series
plot_intercomp_scores_ts(date_vec, np_vec, …)	plots a time series of radar intercomparison scores
plot_ml_ts(dt_ml_arr, ml_top_avg_arr, … [, …])	plots a time series of melting layer data
plot_sun_hits(field, field_name, fname_list, …)	plots the sun hits

Continued on next page

Table 1 – continued from previous page

plot_sun_retrieval_ts(sun_retrieval, . . . [, . . .])	plots sun retrieval time series series
get_colobar_label(field_dict, field_name)	creates the colorbar label using field metadata
get_field_name(field_dict, field)	Return a nice field name for a particular field
_plot_time_range(rad_time, rad_range, . . . [, . . .])	plots a time-range plot

pyrad.graph.**get_colobar_label**(*field_dict*, *field_name*)
　　creates the colorbar label using field metadata

　　　　Parameters

　　　　　　field_dict [dict] dictionary containing field metadata

　　　　　　field_name [str] name of the field

　　　　Returns

　　　　　　label [str] colorbar label

pyrad.graph.**get_field_name**(*field_dict*, *field*)
　　Return a nice field name for a particular field

　　　　Parameters

　　　　　　field_dict [dict] dictionary containing field metadata

　　　　　　field [str] name of the field

　　　　Returns

　　　　　　field_name [str] the field name

pyrad.graph.**plot_along_coord**(*xval_list*, *yval_list*, *fname_list*, *labelx='coord'*, *labely='Value'*, *labels=None*, *title='Plot along coordinate'*, *colors=None*, *linestyles=None*, *ymin=None*, *ymax=None*, *dpi=72*)
　　plots data along a certain radar coordinate

　　　　Parameters

　　　　　　xval_list [list of float arrays] the x values, range, azimuth or elevation

　　　　　　yval_list [list of float arrays] the y values. Parameter to plot

　　　　　　fname_list [list of str] list of names of the files where to store the plot

　　　　　　labelx [str] The label of the X axis

　　　　　　labely [str] The label of the Y axis

　　　　　　labels [array of str] The label of the legend

　　　　　　title [str] The figure title

　　　　　　colors [array of str] Specifies the colors of each line

　　　　　　linestyles [array of str] Specifies the line style of each line

　　　　　　ymin, ymax: float Lower/Upper limit of y axis

　　　　　　dpi [int] dots per inch

　　　　Returns

　　　　　　fname_list [list of str] list of names of the created plots

pyrad.graph.**plot_antenna_pattern**(*antpattern*, *fname_list*, *labelx='Angle [Deg]'*, *linear=False*, *twoway=False*, *title='Antenna Pattern'*, *ymin=None*, *ymax=None*, *dpi=72*)

> plots an antenna pattern

> > **Parameters**

> > > **antpattern** [dict] dictionary with the angle and the attenuation

> > > **value** [float array] values of the time series

> > > **fname_list** [list of str] list of names of the files where to store the plot

> > > **labelx** [str] The label of the X axis

> > > **linear** [boolean] if true data is in linear units

> > > **linear** [boolean] if true data represents the two way attenuation

> > > **titl** [str] The figure title

> > > **ymin, ymax: float** Lower/Upper limit of y axis

> > > **dpi** [int] dots per inch

> > **Returns**

> > > **fname_list** [list of str] list of names of the created plots

pyrad.graph.**plot_bscope**(*radar*, *field_name*, *ind_sweep*, *prdcfg*, *fname_list*)

> plots a B-Scope (angle-range representation)

> > **Parameters**

> > > **radar** [Radar object] object containing the radar data to plot

> > > **field_name** [str] name of the radar field to plot

> > > **ind_sweep** [int] sweep index to plot

> > > **prdcfg** [dict] dictionary containing the product configuration

> > > **fname_list** [list of str] list of names of the files where to store the plot

> > **Returns**

> > > **fname_list** [list of str] list of names of the created plots

pyrad.graph.**plot_cappi**(*radar*, *field_name*, *altitude*, *prdcfg*, *fname_list*, *save_fig=True*)

> plots a Constant Altitude Plan Position Indicator CAPPI

> > **Parameters**

> > > **radar** [Radar object] object containing the radar data to plot

> > > **field_name** [str] name of the radar field to plot

> > > **altitude** [float] the altitude [m MSL] to be plotted

> > > **prdcfg** [dict] dictionary containing the product configuration

> > > **fname_list** [list of str] list of names of the files where to store the plot

> > > **save_fig** [bool] if true save the figure. If false it does not close the plot and returns the handle to the figure

> > **Returns**

> > > **fname_list** [list of str or]

> > **fig, ax** [tupple] list of names of the saved plots or handle of the figure an axes

pyrad.graph.**plot_density**(*hist_obj, hist_type, field_name, ind_sweep, prdcfg, fname_list, quantiles=[25.0, 50.0, 75.0], ref_value=0.0, vmin=None, vmax=None*)

> density plot (angle-values representation)

> > **Parameters**

> > > **hist_obj** [histogram object] object containing the histogram data to plot

> > > **hist_type** [str] type of histogram (instantaneous data or cumulative)

> > > **field_name** [str] name of the radar field to plot

> > > **ind_sweep** [int] sweep index to plot

> > > **prdcfg** [dict] dictionary containing the product configuration

> > > **fname_list** [list of str] list of names of the files where to store the plot

> > > **quantiles** [array] the quantile lines to plot

> > > **ref_value** [float] the reference value

> > > **vmin, vmax** [float] Minim and maximum extend of the vertical axis

> > **Returns**

> > > **fname_list** [list of str] list of names of the created plots

pyrad.graph.**plot_field_coverage**(*xval_list, yval_list, fname_list, labelx='Azimuth (deg)', labely='Range extension [m]', labels=None, title='Field coverage', ymin=None, ymax=None, xmeanval=None, ymeanval=None, labelmeanval=None, dpi=72*)

> plots a time series

> > **Parameters**

> > > **xval_list** [list of float arrays] the x values, azimuth

pyrad.graph.**plot_latlon_slice**(*grid*, *field_name*, *coord1*, *coord2*, *prdcfg*, *fname_list*)

>plots a croos section crossing two points in the grid

>>>**Parameters**

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

coord1 [tupple of floats] lat, lon of the first point

coord2 [tupple of floats] lat, lon of the second point

fname_list [list of str] list of names of the files where to store the plot

> Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.**plot_longitude_slice**(*grid*, *field_name*, *lon*, *lat*, *prdcfg*, *fname_list*)
    plots a longitude slice from gridded data

> Parameters

grid [Grid object] object containing the gridded data to plot

field_name [str] name of the radar field to plot

lon, lat [float] coordinates of the slice to plot

prdcfg [dict] dictionary containing the product configuration

fname_list [list of str] list of names of the files where to store the plot

> Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.**plot_ml_ts**(*dt_ml_arr*, *ml_top_avg_arr*, *ml_top_std_arr*, *thick_avg_arr*, *thick_std_arr*, *nrays_valid_arr*, *nrays_total_arr*, *fname_list*, *labelx='Time UTC'*, *titl='Melting layer time series'*, *dpi=72*)
    plots a time series of melting layer data

> Parameters

dt_ml_arr [datetime object] time of the time series

np_vec [int array] number of points

meanbias_vec, medianbias_vec, modebias_vec [float array] mean, median and mode bias

quant25bias_vec, quant75bias_vec: 25th and 75th percentile of the bias

corr_vec [float array] correlation

slope_vec, intercep_vec [float array] slope and intercep of a linear regression

intercep_slope1_vec [float] the intercep point of a inear regression of slope 1

ref_value [float] the reference value

np_min [int] The minimum number of points to consider the result valid

corr_min [float] The minimum correlation to consider the results valid

labelx [str] The label of the X axis

titl [str] The figure title

> Returns

fname_list [list of str] list of names of the created plots

pyrad.graph.**plot_monitoring_ts**(*date*, *np_t*, *cquant*, *lquant*, *hquant*, *field_name*, *fname_list*, *ref_value=None*, *vmin=None*, *vmax=None*, *np_min=0*, *labelx='Time [UTC]'*, *labely='Value'*, *titl='Time Series'*, *dpi=72*)

    plots a time series of monitoring data

        Parameters

            date [datetime object] time of the time series

            np_t [int array] number of points

            cquant, lquant, hquant [float array] values of the central, low and high quantiles

            field_name [str] name of the field

            fname_list [list of str] list of names of the files where to store the plot

            ref_value [float] the reference value

            vmin, vmax [float] The limits of the y axis

            np_min [int] minimum number of points to consider the sample plotable

            labelx [str] The label of the X axis

            labely [str] The label of the Y axis

            titl [str] The figure title

            dpi [int] dots per inch

        Returns

            fname_list [list of str] list of names of the created plots

pyrad.graph.**plot_pos**(*lat*, *lon*, *alt*, *fname_list*, *ax=None*, *fig=None*, *save_fig=True*, *sort_altitude='No'*, *dpi=72*, *alpha=1.0*, *cb_label='height [m MSL]'*, *titl='Position'*, *xlabel='Lon [Deg]'*, *ylabel='Lat [Deg]'*, *limits=None*, *vmin=None*, *vmax=None*)

    plots a trajectory on a Cartesian surface

        Parameters

            lat, lon, alt [float array] Points coordinates

            fname_list [list of str] list of names of the files where to store the plot

            fig [Figure] Figure to add the colorbar to. If none a new figure will be created

            ax [Axis] Axis to plot on. if fig is None a new axis will be created

            save_fig [bool] if true save the figure if false it does not close the plot and returns the handle to the figure

            sort_altitude [str] String indicating whether to sort the altitude data. Can be 'No', 'Lowest_on_top' or 'Highest_on_top'

            dpi [int] Pixel density

            alpha [float] Transparency

            cb_label [str] Color bar label

            titl [str] Plot title

            limits [tupple or None] The limits of the field to plot

        Returns

> **fname_list** [list of str or]
>
> **fig, ax** [tupple] list of names of the saved plots or handle of the figure an axes

pyrad.graph.**plot_ppi**(*radar*, *field_name*, *ind_el*, *prdcfg*, *fname_list*, *plot_type='PPI'*, *titl=None*, *step=None*, *quantiles=None*, *save_fig=True*)

>> **ax** [Axis] Axis to plot on. if fig is None a new axis will be created
>>
>> **save_fig** [bool] if true save the figure if false it does not close the plot and returns the handle
>> to the figure

> **Returns**

>> **fname_list** [list of str or]
>>
>> **fig, ax** [tupple] list of names of the saved plots or handle of the figure an axes

UTILITIES (`PYRAD.UTIL`)

Functions to read and write data and configuration files.

6.1 Radar Utilities

get_data_along_rng(radar, field_name, ... [, ...])	Get data at particular (azimuths, elevations)
get_data_along_azi(radar, field_name, ... [, ...])	Get data at particular (ranges, elevations)
get_data_along_ele(radar, field_name, ... [, ...])	Get data at particular (ranges, azimuths)
get_ROI(radar, fieldname, sector)	filter out any data outside the region of interest defined by sector
rainfall_accumulation(t_in_vec, val_in_vec)	Computes the rainfall accumulation of a time series over a given period
time_series_statistics(t_in_vec, val_in_vec)	Computes statistics over a time-averaged series.
join_time_series(t1, val1, t2, val2[, dropnan])	joins time_series.
get_range_bins_to_avg(rad1_rng, rad2_rng)	Compares the resolution of two radars and determines if and which radar has to be averaged and the length of the averaging window
find_ray_index(ele_vec, azi_vec, ele, azi[, ...])	Find the ray index corresponding to a particular elevation and azimuth
find_rng_index(rng_vec, rng[, rng_tol])	Find the range index corresponding to a particular range
find_nearest_gate(radar, lat, lon[, latlon_tol])	Find the radar gate closest to a lat,lon point
find_neighbour_gates(radar, azi, rng[, ...])	Find the neighbouring gates within +-delta_azi and +-delta_rng
find_colocated_indexes(radar1, radar2, ...)	Given the theoretical elevation, azimuth and range of the co-located gates of two radars and a given tolerance returns the indices of the gates for the current radars
get_target_elevations(radar_in)	Gets RHI target elevations
get_fixed_rng_data(radar, field_names, fixed_rng)	Creates a 2D-grid with (azi, ele) data at a fixed range
time_avg_range(timeinfo, avg_starttime, ...)	finds the new start and end time of an averaging
get_closest_solar_flux(hit_datetime_list, ...)	finds the solar flux measurement closest to the sun hit
create_sun_hits_field(rad_el, rad_az, ...)	creates a sun hits field from the position and power of the sun hits

Continued on next page

Table 1 – continued from previous page

create_sun_retrieval_field(par, field_name, ...)	creates a sun retrieval field from the retrieval parameters
compute_quantiles(field[, quantiles])	computes quantiles
compute_quantiles_from_hist(bin_centers, hist)	computes quantiles from histograms
compute_quantiles_sweep(field, ray_start, ...)	computes quantiles of a particular sweep
compute_2d_hist(field1, field2, field_name1, ...)	computes a 2D histogram of the data
compute_1d_stats(field1, field2)	returns statistics of data
compute_2d_stats(field1, field2, ...[, ...])	computes a 2D histogram and statistics of the data
compute_histogram(field, field_name[, ...])	computes histogram of the data
compute_histogram_sweep(field, ray_start, ...)	computes histogram of the data in a particular sweep
belongs_roi_indices(lat, lon, roi)	Get the indices of points that belong to roi in a list of points
compute_profile_stats(field, gate_altitude, ...)	Compute statistics of vertical profile
compute_directional_stats(field[, avg_type, ...])	Computes the mean or the median along one of the axis (ray or range)
project_to_vertical(data_in, data_height, ...)	Projects radar data to a regular vertical grid
quantiles_weighted(values[, weight_vector, ...])	Given a set of values and weights, compute the weighted quantile(s).

pyrad.util.**belongs_roi_indices**(*lat*, *lon*, *roi*)

> Get the indices of points that belong to roi in a list of points

> > **Parameters**

> > > **lat, lon** [float arrays] latitudes and longitudes to check

> > > **roi** [dict] Dictionary describing the region of interest

> > **Returns**

> > > **inds** [array of ints] list of indices of points belonging to ROI

> > > **is_roi** [str] Whether the list of points is within the region of interest. Can be 'All', 'None', 'Some'

pyrad.util.**compute_1d_stats**(*field1*, *field2*)

> returns statistics of data

> > **Parameters**

> > > **field1, field2** [ndarray 1D] the two fields to compare

> > **Returns**

> > > **stats** [dict] a dictionary with statistics

pyrad.util.**compute_2d_hist**(*field1*, *field2*, *field_name1*, *field_name2*, *step1=None*, *step2=None*)

> computes a 2D histogram of the data

> > **Parameters**

> > > **field1, field2** [ndarray 2D] the radar fields

> > > **field_name1, field_name2** [str] field names

> > > **step1, step2** [float] size of the bins

> > **Returns**

> > **H** [float array 2D] The bi-dimensional histogram of samples x and y
>
> > **xedges, yedges** [float array] the bin edges along each dimension

pyrad.util.**compute_2d_stats**(*field1*, *field2*, *field_name1*, *field_name2*, *step1=None*, *step2=None*)
> computes a 2D histogram and statistics of the data
>
> > **Parameters**
> >
> > > **field1, field2** [ndarray 2D] the two fields
> > >
> > > **field_name1, field_nam2: str** the name of the fields
> > >
> > > **step1, step2** [float] size of bin
> >
> > **Returns**
> >
> > > **hist_2d** [array] the histogram
> > >
> > > **bin_edges1, bin_edges2** [float array] The bin edges
> > >
> > > **stats** [dict] a dictionary with statistics

pyrad.util.**compute_directional_stats**(*field*, *avg_type='mean'*, *nvalid_min=1*, *axis=0*)
> Computes the mean or the median along one of the axis (ray or range)
>
> > **Parameters**
> >
> > > **field** [ndarray] the radar field
> > >
> > > **avg_type :str** the type of average: 'mean' or 'median'
> > >
> > > **nvalid_min** [int] the minimum number of points to consider the stats valid. Default 1
> > >
> > > **axis** [int] the axis along which to compute (0=ray, 1=range)
> >
> > **Returns**
> >
> > > **values** [ndarray 1D] The resultant statistics
> > >
> > > **nvalid** [ndarray 1D] The number of valid points used in the computation

pyrad.util.**compute_histogram**(*field*, *field_name*, *bin_edges=None*, *step=None*, *vmin=None*, *vmax=None*)
> computes histogram of the data
>
> > **Parameters**
> >
> > > **field** [ndarray 2D] the radar field
> > >
> > > **field_name: str or none** name of the field
> > >
> > > **bins_edges :ndarray 1D** the bin edges
> > >
> > > **step** [float] size of bin
> > >
> > > **vmin, vmax** [float] The minimum and maximum value of the histogram
> >
> > **Returns**
> >
> > > **bin_edges** [float array] interval of each bin
> > >
> > > **values** [float array] values at each bin

pyrad.util.**compute_histogram_sweep**(*field*, *ray_start*, *ray_end*, *field_name*, *step=None*)
> computes histogram of the data in a particular sweep
>
> > **Parameters**
> >
> > > **field** [ndarray 2D] the radar field

ray_start, ray_end [int] starting and ending ray indexes

field_name: str name of the field

step [float] size of bin

Returns

bin_edges [float array] interval of each bin

values [float array] values at each bin

pyrad.util.**compute_profile_stats**(*field*, *gate_altitude*, *h_vec*, *h_res*, *quantity='quantiles'*, *quantiles=array([0.25, 0.5, 0.75])*, *nvalid_min=4*, *std_field=None*, *np_field=None*, *make_linear=False*, *include_nans=False*)

Compute statistics of vertical profile

Parameters

field [ndarray] the radar field

gate_altitude: ndarray the altitude at each radar gate [m MSL]

h_vec [1D ndarray] height vector [m MSL]

h_res [float] heigh resolution [m]

quantity [str] The quantity to compute. Can be ['quantiles', 'mode', 'regression_mean', 'mean']. If 'mean', the min, max, and average is computed.

quantiles [1D ndarray] the quantiles to compute

nvalid_min [int] the minimum number of points to consider the stats valid

std_field [ndarray] the standard deviation of the regression at each range gate

np_field [ndarray] the number of points used to compute the regression at each range gate

make_linear [Boolean] If true the data is transformed into linear coordinates before taking the mean

include_nans [Boolean] If true NaN will be considered as zeros

Returns

vals [ndarray 2D] The resultant statistics

val_valid [ndarray 1D] The number of points to compute the stats used at each height level

pyrad.util.**compute_quantiles**(*field*, *quantiles=None*)

computes quantiles

Parameters

field [ndarray 2D] the radar field

ray_start, ray_end [int] starting and ending ray indexes

quantiles: float array list of quantiles to compute

Returns

quantiles [float array] list of quantiles

values [float array] values at each quantile

pyrad.util.**compute_quantiles_from_hist**(*bin_centers*, *hist*, *quantiles=None*)

computes quantiles from histograms

Parameters

> > > **bin_centers** [ndarray 1D] the bins
> > >
> > > **hist** [ndarray 1D] the histogram
> > >
> > > **quantiles: float array** list of quantiles to compute
> >
> > **Returns**
> >
> > > **quantiles** [float array] list of quantiles
> > >
> > > **values** [float array] values at each quantile

pyrad.util.**compute_quantiles_sweep**(*field*, *ray_start*, *ray_end*, *quantiles=None*)
> computes quantiles of a particular sweep
>
> > **Parameters**
> >
> > > **field** [ndarray 2D] the radar field
> > >
> > > **ray_start, ray_end** [int] starting and ending ray indexes
> > >
> > > **quantiles: float array** list of quantiles to compute
> >
> > **Returns**
> >
> > > **quantiles** [float array] list of quantiles
> > >
> > > **values** [float array] values at each quantile

pyrad.util.**create_sun_hits_field**(*rad_el*, *rad_az*, *sun_el*, *sun_az*, *data*, *imgcfg*)
> creates a sun hits field from the position and power of the sun hits
>
> > **Parameters**
> >
> > > **rad_el, rad_az, sun_el, sun_az** [ndarray 1D] azimuth and elevation of the radar and the sun
> > > respectively in degree
> > >
> > > **data** [masked ndarray 1D] the sun hit data
> > >
> > > **imgcfg: dict** a dictionary specifying the ranges and resolution of the field to create
> >
> > **Returns**
> >
> > > **field** [masked ndarray 2D] the sun hit field

pyrad.util.**create_sun_retrieval_field**(*par*, *field_name*, *imgcfg*, *lant=0.0*)
> creates a sun retrieval field from the retrieval parameters
>
> > **Parameters**
> >
> > > **par** [ndarray 1D] the 5 retrieval parameters
> > >
> > > **imgcfg: dict** a dictionary specifying the ranges and resolution of the field to create
> >
> > **Returns**
> >
> > > **field** [masked ndarray 2D] the sun retrieval field

pyrad.util.**find_colocated_indexes**(*radar1*, *radar2*, *rad1_ele*, *rad1_azi*, *rad1_rng*,
> > > > > > *rad2_ele*, *rad2_azi*, *rad2_rng*, *ele_tol=0.5*, *azi_tol=0.5*,
> > > > > > *rng_tol=50.0*)
> Given the theoretical elevation, azimuth and range of the co-located gates of two radars and a given tolerance
> returns the indices of the gates for the current radars
>
> > **Parameters**
> >
> > > **radar1, radar2** [radar objects] the two radar objects
> > >
> > > **rad1_ele, rad1_azi, rad1_rng** [array of floats] the radar coordinates of the radar1 gates

> > > **rad2_ele, rad2_azi, rad2_rng** [array of floats] the radar coordinates of the radar2 gates
> > >
> > > **ele_tol, azi_tol** [floats] azimuth and elevation angle tolerance [deg]
> > >
> > > **rng_tol** [float] range Tolerance [m]
> >
> > **Returns**
> >
> > > **ind_ray_rad1, ind_rng_rad1, ind_ray_rad2, ind_rng_rad2** [array of ints] the ray and range indexes of each radar gate

pyrad.util.**find_nearest_gate**(*radar*, *lat*, *lon*, *latlon_tol=0.0005*)
> Find the radar gate closest to a lat,lon point
>
> > **Parameters**
> >
> > > **radar** [radar object] the radar object
> > >
> > > **lat, lon** [float] The position of the point
> > >
> > > **latlon_tol** [float] The tolerance around this point
> >
> > **Returns**
> >
> > > **ind_ray, ind_rng** [int] The ray and range index
> > >
> > > **azi, rng** [float] the range and azimuth position of the gate

pyrad.util.**find_neighbour_gates**(*radar*, *azi*, *rng*, *delta_azi=None*, *delta_rng=None*)
> Find the neighbouring gates within +-delta_azi and +-delta_rng
>
> > **Parameters**
> >
> > > **radar** [radar object] the radar object
> > >
> > > **azi, rng** [float] The azimuth [deg] and range [m] of the central gate
> > >
> > > **delta_azi, delta_rng** [float] The extend where to look for
> >
> > **Returns**
> >
> > > **inds_ray_aux, ind_rng_aux** [int] The indices (ray, rng) of the neighbouring gates

pyrad.util.**find_ray_index**(*ele_vec*, *azi_vec*, *ele*, *azi*, *ele_tol=0.0*, *azi_tol=0.0*, *nearest='azi'*)
> Find the ray index corresponding to a particular elevation and azimuth
>
> > **Parameters**
> >
> > > **ele_vec, azi_vec** [float arrays] The elevation and azimuth data arrays where to look for
> > >
> > > **ele, azi** [floats] The elevation and azimuth to search
> > >
> > > **ele_tol, azi_tol** [floats] Tolerances [deg]
> > >
> > > **nearest** [str] criteria to define wich ray to keep if multiple rays are within tolerance. azi: nearest azimuth, ele: nearest elevation
> >
> > **Returns**
> >
> > > **ind_ray** [int] The ray index

pyrad.util.**find_rng_index**(*rng_vec*, *rng*, *rng_tol=0.0*)
> Find the range index corresponding to a particular range
>
> > **Parameters**
> >
> > > **rng_vec** [float array] The range data array where to look for
> > >
> > > **rng** [float] The range to search

> **rng_tol** [float] Tolerance [m]

> > Returns

> > > **ind_rng** [int] The range index

pyrad.util.**get_ROI**(*radar*, *fieldname*, *sector*)

> filter out any data outside the region of interest defined by sector

> > Parameters

> > > **radar** [radar object] the radar object where the data is

> > > **fieldname** [str] name of the field to filter

> > > **sector** [dict] a dictionary defining the region of interest

> > Returns

> > > **roi_flag** [ndarray] a field array with ones in gates that are in the Region of Interest

pyrad.util.**get_closest_solar_flux**(*hit_datetime_list*, *flux_datetime_list*, *flux_value_list*)

> finds the solar flux measurement closest to the sun hit

> > Parameters

> > > **hit_datetime_list** [datetime array] the date and time of the sun hit

> > > **flux_datetime_list** [datetime array] the date and time of the solar flux measurement

> > > **flux_value_list: ndarray 1D** the solar flux values

> > Returns

> > > **flux_datetime_closest_list** [datetime array] the date and time of the solar flux measurement closest to sun hit

> > > **flux_value_closest_list** [ndarray 1D] the solar flux values closest to the sun hit time

pyrad.util.**get_data_along_azi**(*radar*, *field_name*, *fix_ranges*, *fix_elevations*, *rng_tol=50.0*, *ang_tol=1.0*, *azi_start=None*, *azi_stop=None*)

> Get data at particular (ranges, elevations)

> > Parameters

> > > **radar** [radar object] the radar object where the data is

> > > **field_name** [str] name of the field to filter

> > > **fix_ranges, fix_elevations: list of floats** List of ranges [m], elevations [deg] couples

> > > **rng_tol** [float] Tolerance between the nominal range and the radar range [m]

> > > **ang_tol** [float] Tolerance between the nominal angle and the radar angle [deg]

> > > **azi_start, azi_stop: float** Start and stop azimuth angle of the data [deg]

> > Returns

> > > **xvals** [list of float arrays] The ranges of each rng, ele pair

> > > **yvals** [list of float arrays] The values

> > > **valid_rng, valid_ele** [float arrays] The rng, ele pairs

pyrad.util.**get_data_along_ele**(*radar*, *field_name*, *fix_ranges*, *fix_azimuths*, *rng_tol=50.0*, *ang_tol=1.0*, *ele_min=None*, *ele_max=None*)

> Get data at particular (ranges, azimuths)

> > Parameters

> > **radar** [radar object] the radar object where the data is
> >
> > **field_name** [str] name of the field to filter
> >
> > **fix_ranges, fix_azimuths: list of floats** List of ranges [m], azimuths [deg] couples
> >
> > **rng_tol** [float] Tolerance between the nominal range and the radar range [m]
> >
> > **ang_tol** [float] Tolerance between the nominal angle and the radar angle [deg]
> >
> > **ele_min, ele_max: float** Min and max elevation angle [deg]
>
> > **Returns**
> >
> > > **xvals** [list of float arrays] The ranges of each rng, ele pair
> > >
> > > **yvals** [list of float arrays] The values
> > >
> > > **valid_rng, valid_ele** [float arrays] The rng, ele pairs

pyrad.util.**get_data_along_rng**(*radar*, *field_name*, *fix_elevations*, *fix_azimuths*, *ang_tol=1.0*, *rmin=None*, *rmax=None*)

> Get data at particular (azimuths, elevations)
>
> > **Parameters**
> >
> > > **radar** [radar object] the radar object where the data is
> > >
> > > **field_name** [str] name of the field to filter
> > >
> > > **fix_elevations, fix_azimuths: list of floats** List of elevations, azimuths couples [deg]
> > >
> > > **ang_tol** [float] Tolerance between the nominal angle and the radar angle [deg]
> > >
> > > **rmin, rmax: float** Min and Max range of the obtained data [m]
> >
> > **Returns**
> >
> > > **xvals** [list of float arrays] The ranges of each azi, ele pair
> > >
> > > **yvals** [list of float arrays] The values
> > >
> > > **valid_azi, valid_ele** [float arrays] The azi, ele pairs

pyrad.util.**get_fixed_rng_data**(*radar*, *field_names*, *fixed_rng*, *rng_tol=50.0*, *ele_min=None*, *ele_max=None*, *azi_min=None*, *azi_max=None*)

> Creates a 2D-grid with (azi, ele) data at a fixed range
>
> > **Parameters**
> >
> > > **radar** [radar object] The radar object containing the data
> > >
> > > **field_name** [str] The field name
> > >
> > > **fixed_rng** [float] The fixed range [m]
> > >
> > > **rng_tol** [float] The tolerance between the nominal range and the actual radar range [m]
> > >
> > > **ele_min, ele_max, azi_min, azi_max** [float or None] The limits of the grid [deg]. If None the limits will be the limits of the radar volume
> >
> > **Returns**
> >
> > > **radar** [radar object] The radar object containing only the desired data

pyrad.util.**get_range_bins_to_avg**(*rad1_rng*, *rad2_rng*)

> Compares the resolution of two radars and determines if and which radar has to be averaged and the length of the averaging window
>
> > **Parameters**

rad1_rng [array] the range of radar 1

rad2_rng [datetime] the range of radar 2

Returns

avg_rad1, avg_rad2 [Boolean] Booleans specifying if the radar data has to be average in range

avg_rad_lim [array with two elements] the limits to the average (centered on each range gate)

pyrad.util.**get_target_elevations**(*radar_in*)

Gets RHI target elevations

Parameters

radar_in [Radar object] current radar object

Returns

target_elevations [1D-array] Azimuth angles

el_tol [float] azimuth tolerance

pyrad.util.**join_time_series**(*t1*, *val1*, *t2*, *val2*, *dropnan=False*)

joins time_series. Only of package pandas is available otherwise returns None.

Parameters

t1 [datetime array] time of first series

val1 [float array] value of first series

t2 [datetime array] time of second series

val2 [float array] value of second series

dropnan [boolean] if True remove NaN from the time series

Returns

t_out_vec [datetime array] the resultant date time after joining the series

val1_out_vec [float array] value of first series

val2_out_vec [float array] value of second series

pyrad.util.**project_to_vertical**(*data_in*, *data_height*, *grid_height*, *interp_kind='none'*, *fill_value=-9999.0*)

Projects radar data to a regular vertical grid

Parameters

data_in [ndarray 1D] the radar data to project

data_height [ndarray 1D] the height of each radar point

grid_height [ndarray 1D] the regular vertical grid to project to

interp_kind [str] The type of interpolation to use: 'none' or 'nearest'

fill_value [float] The fill value used for interpolation

Returns

data_out [ndarray 1D] The projected data

pyrad.util.**quantiles_weighted**(*values*, *weight_vector=None*, *quantiles=array([0.5])*, *weight_threshold=None*, *data_is_log=False*)

    Given a set of values and weights, compute the weighted quantile(s).

pyrad.util.**rainfall_accumulation**(*t_in_vec*, *val_in_vec*, *cum_time=3600.0*, *base_time=0.0*, *dropnan=False*)

    Computes the rainfall accumulation of a time series over a given period

        Parameters

            t_in_vec [datetime array] the input date and time array

            val_in_vec [float array] the input values array [mm/h]

            cum_time [int] accumulation time [s]

            base_time [int] base time [s]

            dropnan [boolean] if True remove NaN from the time series

        Returns

            t_out_vec [datetime array] the output date and time array

            val_out_vec [float array] the output values array

            np_vec [int array] the number of samples at each period

pyrad.util.**time_avg_range**(*timeinfo*, *avg_starttime*, *avg_endtime*, *period*)

    finds the new start and end time of an averaging

        Parameters

            timeinfo [datetime] the current volume time

            avg_starttime [datetime] the current average start time

            avg_endtime: datetime the current average end time

            period: float the averaging period

        Returns

            new_starttime [datetime] the new average start time

            new_endtime [datetime] the new average end time

pyrad.util.**time_series_statistics**(*t_in_vec*, *val_in_vec*, *avg_time=3600*, *base_time=1800*, *method='mean'*, *dropnan=False*)

    Computes statistics over a time-averaged series. Only of package pandas is available otherwise returns None

        Parameters

            t_in_vec [datetime array] the input date and time array

            val_in_vec [float array] the input values array

            avg_time [int] averaging time [s]

            base_time [int] base time [s]

            method [str] statistical method

            dropnan [boolean] if True remove NaN from the time series

        Returns

            t_out_vec [datetime array] the output date and time array

            val_out_vec [float array] the output values array
